# Faust Libraries

NOTE: this documentation was automatically generated.

This page provides information on how to use the Faust libraries.

The /libraries folder contains the different Faust libraries. If you wish to add your own functions to this library collection, you can refer to the "Contributing" section providing a set of coding conventions.

WARNING: These libraries replace the "old" Faust libraries. They are still being beta tested so you might encounter bugs while using them. If your codes still use the "old" Faust libraries, you might want to try to use Bart Brouns' script that automatically makes an old Faust code compatible with the new libraries: <a href="https://github.com/magnetophon/faustCompressors/blob/master/newlib.sh">https://github.com/magnetophon/faustCompressors/blob/master/newlib.sh</a>. If you find a bug, please report it at rmichon\_at\_ccrma\_dot\_stanford\_dot\_edu. Thanks;)!

## Using the Faust Libraries

The easiest and most standard way to use the Faust libraries is to import stdfaust.lib in your Faust code:

```
import("stdfaust.lib");
```

This will give you access to all the Faust libraries through a series of environments:

```
• sf: all.lib
• an: analyzers.lib
• ba: basics.lib
• co: compressors.lib
• de: delays.lib
• dm: demos.lib
• en: envelopes.lib
• fi: filters.lib
• ho: hoa.lib
• ma: maths.lib
• ef: misceffects.lib
• os: oscillators.lib
• no: noises.lib
• pf: phaflangers.lib
• pm: physmodels.lib
• re: reverbs.lib
• ro: routes.lib
• si: signals.lib
• sp: spats.lib
• sy: synths.lib
• ve: vaeffects.lib
```

Environments can then be used as follows in your Faust code:

```
import("stdfaust.lib");
process = os.osc(440);
```

In this case, we're calling the osc function from oscillators.lib.

You can also access all the functions of all the libraries directly using the sf environment:

```
import("stdfaust.lib");
process = sf.osc(440);
```

Alternatively, environments can be created by hand:

```
os = library("oscillators.lib");
process = os.osc(440);
Finally, libraries can be simply imported in the Faust code (not recommended):
import("oscillators.lib");
process = osc(440);
```

### Contributing

If you wish to add a function to any of these libraries or if you plan to add a new library, make sure that you follow the following conventions:

#### **New Functions**

• All functions must be preceded by a markdown documentation header respecting the following format (open the source code of any of the libraries for an example):

- Every time a new function is added, the documentation should be updated simply by running make doclib.
- The environment system (e.g. os.osc) should be used when calling a function declared in another library (see the section on *Using the Faust Libraries*).
- Try to reuse exisiting functions as much as possible.
- If you have any question, send an e-mail to rmichon\_at\_ccrma\_dot\_stanford\_dot\_edu.

#### **New Libraries**

- Any new "standard" library should be declared in stdfaust.lib with its own environment (2 letters see stdfaust.lib).
- Any new "standard" library must be added to generateDoc.
- Functions must be organized by sections.
- Any new library should at least declare a name and a version.
- The comment based markdown documentation of each library must respect the following format (open the source code of any of the libraries for an example):

```
// Description
// * Section Name 1
// * Section Name 2
// * ...
//
// It should be used using the `[...]` environment:
// [...] = library("libraryName");
// process = [...].functionCall;
// ***
//
// Another option is to import `stdfaust.lib` which already contains the `[...]`
// environment:
//
// ---
// import("stdfaust.lib");
// process = [...].functionCall;
// ---
//======== Section Name =========
// Description
```

• If you have any question, send an e-mail to rmichon\_at\_ccrma\_dot\_stanford\_dot\_edu.

#### General Organization

Only the libraries that are considered to be "standard" are documented:

- analyzers.lib
- basics.lib
- compressors.lib
- delays.lib
- demos.lib
- envelopes.lib
- filters.lib
- hoa.lib
- maths.lib
- misceffects.lib
- oscillators.lib
- noises.lib
- phaflangers.lib
- physmodels.lib
- reverbs.lib
- routes.lib
- signals.lib
- spats.lib
- synths.lib
- tonestacks.lib (not documented but example in /examples/misc)
- tubes.lib (not documented but example in /examples/misc)
- vaeffects.lib

Other deprecated libraries such as music.lib, etc. are present but are not documented to not confuse new users.

The doumentation of each library can be found in /documentation/library.html or in /documentation/library.pdf.

The /examples directory contains all the examples from the /examples folder of the Faust distribution as well as new ones. Most of them were updated to reflect the coding conventions described in the next section. Examples are organized by types in different folders. The /old folder contains examples that are fully deprecated, probably because they were integrated to the libraries and fully rewritten (see freeverb.dsp for example). Examples using deprecated libraries were integrated to the general tree but a warning comment was added at their beginning to point readers to the right library and function.

### **Coding Conventions**

In order to have a uniformized library system, we established the following conventions (that hopefully will be followed by others when making modifications to them :-) ).

#### Documentation

- All the functions that we want to be "public" are documented.
- We used the faust2md "standards" for each library: //### for main title (library name equivalent to # in markdown), //=== for section declarations (equivalent to ## in markdown) and //--- for function declarations (equivalent to #### in markdown see basics.lib for an example).
- Sections in function documentation should be declared as #### markdown title.
- Each function documentation provides a "Usage" section (see basics.lib).

#### Library Import

To prevent cross-references between libraries we generalized the use of the library("") system for function calls in all the libraries. This means that everytime a function declared in another library is called, the environment corresponding to this library needs to be called too. To make things easier, a stdfaust.lib library was created and is imported by all the libraries:

```
an = library("analyzers.lib");
ba = library("basics.lib");
co = library("compressors.lib");
de = library("delays.lib");
dm = library("demos.lib");
en = library("envelopes.lib");
fi = library("filters.lib");
ho = library("hoa.lib");
ma = library("maths.lib");
ef = library("misceffects.lib");
os = library("oscillators.lib");
no = library("noises.lib");
pf = library("phaflangers.lib");
pm = library("physmodels.lib");
re = library("reverbs.lib");
ro = library("routes.lib");
sp = library("spats.lib");
si = library("signals.lib");
sy = library("synths.lib");
ve = library("vaeffects.lib");
```

For example, if we wanted to use the **smooth** function which is now declared in **signals.lib**, we would do the following:

```
import("stdfaust.lib");
```

```
process = si.smooth(0.999);
```

This standard is only used within the libraries: nothing prevents coders to still import signals.lib directly and call smooth without ro., etc.

#### "Demo" Functions

"Demo" functions are placed in demos.lib and have a built-in user interface (UI). Their name ends with the \_demo suffix. Each of these function have a .dsp file associated to them in the /examples folder.

Any function containing UI elements should be placed in this library and respect these standards.

#### "Standard" Functions

"Standard" functions are here to simplify the life of new (or not so new) Faust coders. They are declared in /libraries/doc/standardFunctions.md and allow to point programmers to preferred functions to carry out a specific task. For example, there are many different types of lowpass filters declared in filters.lib and only one of them is considered to be standard, etc.

#### Copyright / License

Now that Faust libraries are less author specific, each function will normally have its own copyright-and-license line in the library source (the .lib file, such as analyzers.lib). If not, see if the function is defined within a section of the .lib file stating the license in source-code comments. If not, then the copyright and license given at the beginning of the .lib file may be assumed, when present. If not, run git blame on the .lib file and ask the person who last edited the function!

Note that it is presently possible for a library function released under one license to utilize another library function having some different license. There is presently no indication of this situation in the Faust compiler output, but such notice is planned. For now, library contributors should strive to use only library functions having compatible licenses, and concerned end-users must manually determine the union of licenses applicable to the library functions they are using.

#### Standard Functions

Dozens of functions are implemented in the Faust libraries and many of them are very specialized and not useful to beginners or to people who only need to use

Faust for basic applications. This section offers an index organized by categories of the "standard Faust functions" (basic filters, effects, synthesizers, etc.). This index only contains functions without a user interface (UI). Faust functions with a built-in UI can be found in demos.lib.

# **Analysis Tools**

Function Type	Function Name	Description
Amplitude Follower	an.amp_follower	Classic analog audio envelope follower
Octave Analyzers	<pre>an.mth_octave_analyzer[N]</pre>	Octave analyzers

## **Basic Elements**

Function Type	Function Name	Description
Beats	ba.beat	Pulses at a specific tempo
Block	si.block	Terminate n signals
Break Point Function	ba.bpf	Beak Point Function (BPF)
Bus	si.bus	Bus of n signals
Bypass (Mono)	ba.bypass1	Mono bypass
Bypass (Stereo)	ba.bypass2	Stereo bypass
Count Elements	ba.count	Count elements in a list
Count Down	ba.countdown	Samples count down
Count Up	ba.countup	Samples count up
Delay (Integer)	de.delay	Integer delay
Delay (Float)	de.fdelay	Fractional delay
Down Sample	ba.downSample	Down sample a signal
Impulsify	ba.impulsify	Turns a signal into an impulse
Sample and Hold	ba.sAndH	Sample and hold
Signal Crossing	ro.cross	Cross n signals
Smoother (Default)	si.smoo	Exponential smoothing
Smoother	si.smooth	Exponential smoothing with controllable pole
Take Element	ba.take	Take en element from a list
Time	ba.time	A simple timer

Function Type	Function Name	Description

# Conversion

Function Type	Function Name	Description
dB to Linear	ba.db2linear	Converts dB to linear values
Linear to dB	ba.linear2db	Converts linear values to dB
MIDI Key to Hz	ba.midikey2hz	Converts a MIDI key number into a frequency
Pole to T60	ba.pole2tau	Converts a pole into a time constant (t60)
Samples to Seconds	ba.samp2sec	Converts samples to seconds
Seconds to Samples	ba.sec2samp	Converts seconds to samples
T60 to Pole	ba.tau2pole	Converts a time constant (t60) into a pole

# Effects

Function Type	Function Name	Description
Auto Wah	ve.autowah	Auto-Wah effect
Compressor	co.compressor_mono	Dynamic range compressor
Distortion	ef.cubicnl	Cubic nonlinearity distortion
Crybaby	ve.crybaby	Crybaby wah pedal
Echo	ef.echo	Simple echo
Flanger	pf.flanger_stereo	Flanging effect
Gate	ef.gate_mono	Mono signal gate
Limiter	co.limiter_1176_R4_mono	Limiter
Phaser	pf.phaser2_stereo	Phaser effect
Reverb (FDN)	re.fdnrev0	Feedback delay network reverberator
Reverb (Freeverb)	re.mono_freeverb	Most "famous" Schroeder reverberator
Reverb (Simple)	re.jcrev	Simple Schroeder reverberator
Reverb (Zita)	re.zita_rev1_stereo	High quality FDN reverberator
Panner	sp.panner	Linear stereo panner
Pitch Shift	ef.transpose	Simple pitch shifter

Function Type	Function Name	Description
Panner	sp.spat	N outputs spatializer
Speaker Simulator	ef.speakerbp	Simple speaker simulator
Stereo Width	ef.stereo_width	Stereo width effect
Vocoder	ve.vocoder	Simple vocoder
Wah	ve.wah4	Wah effect

# **Envelope Generators**

Function Type	Function Name	Description
ADSR	en.adsr	Attack/Decay/Sustain/Release envelope generator
AR	en.ar	Attack/Release envelope generator
ASR	en.asr	Attack/Sustain/Release envelope generator
Exponential	en.smoothEnvelope	Exponential envelope generator

# Filters

Function Type	Function Name	Description
Bandpass (Butterworth)	fi.bandpass	Generic butterworth bandpass
Bandpass (Resonant)	fi.resonbp	Virtual analog resonant bandpass
Bandstop (Butterworth)	fi.bandstop	Generic butterworth bandstop
Biquad	fi.tf2	"Standard" biquad filter
Comb (Allpass)	fi.allpass_fcomb	Schroeder allpass comb filter
Comb (Feedback)	fi.fb_fcomb	Feedback comb filter
Comb (Feedforward)	fi.ff_fcomb	Feed-forward comb filter.
DC Blocker	fi.dcblocker	Default de blocker
Filterbank	fi.filterbank	Generic filter bank
FIR (Arbitrary Order)	fi.fir	Nth-order FIR filter
High Shelf	fi.high_shelf	High shelf
Highpass (Butterworth)	fi.highpass	Nth-order Butterworth highpass
Highpass (Resonant)	fi.resonhp	Virtual analog resonant highpass

Function Type	Function Name	Description
IIR (Arbitrary Order)	fi.iir	Nth-order IIR filter
Level Filter	fi.levelfilter	Dynamic level lowpass
Low Shelf	fi.low_shelf	Low shelf
Lowpass (Butterworth)	fi.lowpass	Nth-order Butterworth lowpass
Lowpass (Resonant)	fi.resonlp	Virtual analog resonant lowpass
Notch Filter	fi.notchw	Simple notch filter
Peak Equalizer	fi.peak_eq	Peaking equalizer section

# ${\bf Oscillators/Sound\ Generators}$

Function Type	Function Name	Description	
Impulse	os.impulse	Generate an impulse on start-up	
Impulse Train	os.imptrain	Band-limited impulse train	
Phasor	os.phasor	Simple phasor	
Pink Noise	no.pink_noise	Pink noise generator	
Pulse Train	os.pulsetrain	Band-limited pulse train	
Pulse Train (Low Frequency)	os.lf_imptrain	Low-frequency pulse train	
Sawtooth	os.sawtooth	Band-limited sawtooth wave	
Sawtooth (Low Frequency)	os.lf_saw	Low-frequency sawtooth wave	
Sine (Filter-Based)	os.osc	Sine oscillator (filter-based)	
Sine (Table-Based)	os.oscsin	Sine oscillator (table-based)	
Square	os.square	Band-limited square wave	
Square (Low Frequency)	os.lf_squarewave	Low-frequency square wave	
Triangle	os.triangle	Band-limited triangle wave	
Triangle (Low Frequency)	os.lf_triangle	Low-frequency triangle wave	
White Noise	no.noise	White noise generator	

# Synths

Function Type	Function Name	Description
Additive Drum	sy.additiveDrum	Additive synthesis drum
Bandpassed Sawtooth	sy.dubDub	Sawtooth through resonant bandpass
Comb String	sy.combString	String model based on a comb filter
FM	sy.fm	Frequency modulation synthesizer
Lowpassed Sawtooth	sy.sawTrombone	"Trombone" based on a filtered sawtooth
Popping Filter	sy.popFilterPerc	Popping filter percussion instrument

# analyzers.lib

Faust Analyzers library. Its official prefix is an.

# **Amplitude Tracking**

#### amp\_follower

Classic analog audio envelope follower with infinitely fast rise and exponential decay. The amplitude envelope instantaneously follows the absolute value going up, but then floats down exponentially. amp\_follower is a standard Faust function.

#### Usage

```
_ : amp_follower(rel) : _
```

#### Where:

• rel: release time = amplitude-envelope time-constant (sec) going down

#### Reference

• Musical Engineer's Handbook, Bernie Hutchins, Ithaca NY, 1975 Electronotes Newsletter, Bernie Hutchins

#### amp\_follower\_ud

Envelope follower with different up and down time-constants (also called a "peak detector").

#### Usage

```
_ : amp_follower_ud(att,rel) : _
```

#### Where:

- att: attack time = amplitude-envelope time constant (sec) going up
- rel: release time = amplitude-envelope time constant (sec) going down

Note We assume rel >> att. Otherwise, consider rel  $\sim$  max(rel,att). For audio, att is normally faster (smaller) than rel (e.g., 0.001 and 0.01). Use amp\_follower\_ar below to remove this restriction.

Reiss <a href="http://www.eecs.qmul.ac.uk/~josh/documents/GiannoulisMassbergReiss-dynamicrangecompression-JAES2012.pdf">http://www.eecs.qmul.ac.uk/~josh/documents/GiannoulisMassbergReiss-dynamicrangecompression-JAES2012.pdf</a>

#### Spectrum-Analyzers

Spectrum-analyzers split the input signal into a bank of parallel signals, one for each spectral band. They are related to the Mth-Octave Filter-Banks in filters.lib. The documentation of this library contains more details about the implementation. The parameters are:

- M: number of band-slices per octave (>1)
- N: total number of bands (>2)
- ftop = upper bandlimit of the Mth-octave bands ( $\langle SR/2 \rangle$

In addition to the Mth-octave output signals, there is a highpass signal containing frequencies from ftop to SR/2, and a "dc band" lowpass signal containing frequencies from 0 (dc) up to the start of the Mth-octave bands. Thus, the N output signals are

```
highpass(ftop), MthOctaveBands(M,N-2,ftop), dcBand(ftop*2^(-M*(N-1)))
```

A Spectrum-Analyzer is defined here as any band-split whose bands span the relevant spectrum, but whose band-signals do not necessarily sum to the original signal, either exactly or to within an allpass filtering. Spectrum analyzer outputs are normally at least nearly "power complementary", i.e., the power spectra of the individual bands sum to the original power spectrum (to within some negligible tolerance).

**Increasing Channel Isolation** Go to higher filter orders - see Regalia et al. or Vaidyanathan (cited below) regarding the construction of more aggressive recursive filter-banks using elliptic or Chebyshev prototype filters.

#### References

- "Tree-structured complementary filter banks using all-pass sections", Regalia et al., IEEE Trans. Circuits & Systems, CAS-34:1470-1484, Dec. 1987
- "Multirate Systems and Filter Banks", P. Vaidyanathan, Prentice-Hall, 1993
- Elementary filter theory: https://ccrma.stanford.edu/~jos/filters/

#### mth\_octave\_analyzer

Octave analyzer. mth\_octave\_analyzer[N] are standard Faust functions.

#### Usage

```
_: mth_octave_analyzer(0,M,ftop,N) : par(i,N,_); // Oth-order Butterworth
_: mth_octave_analyzer6e(M,ftop,N) : par(i,N,_); // 6th-order elliptic

Also for convenience:
_: mth_octave_analyzer3(M,ftop,N) : par(i,N,_); // 3d-order Butterworth
_: mth_octave_analyzer5(M,ftop,N) : par(i,N,_); // 5th-roder Butterworth
mth_octave_analyzer_default = mth_octave_analyzer6e;
```

#### Where:

- 0: order of filter used to split each frequency band into two
- M: number of band-slices per octave
- ftop: highest band-split crossover frequency (e.g., 20 kHz)
- N: total number of bands (including dc and Nyquist)

## Mth-Octave Spectral Level

Spectral Level: Display (in bar graphs) the average signal level in each spectral band.

#### mth\_octave\_spectral\_level6e

Spectral level display.

#### Usage:

```
_ : mth_octave_spectral_level6e(M,ftop,NBands,tau,dB_offset) : _;
```

#### Where:

- M: bands per octave
- ftop: lower edge frequency of top band
- NBands: number of passbands (including highpass and dc bands),
- tau: spectral display averaging-time (time constant) in seconds,
- dB offset: constant dB offset in all band level meters.

Also for convenience:

```
mth_octave_spectral_level_default = mth_octave_spectral_level6e;
spectral_level = mth_octave_spectral_level(2,10000,20);
```

#### [third|half]\_octave\_[analyzer|filterbank]

A bunch of special cases based on the different analyzer functions described above:

```
third_octave_analyzer(N) = mth_octave_analyzer_default(3,10000,N);
third_octave_filterbank(N) = mth_octave_filterbank_default(3,10000,N);
half_octave_analyzer(N) = mth_octave_analyzer_default(2,10000,N);
half_octave_filterbank(N) = mth_octave_filterbank_default(2,10000,N);
octave_filterbank(N) = mth_octave_filterbank_default(1,10000,N);
octave_analyzer(N) = mth_octave_analyzer_default(1,10000,N);
```

Usage See mth\_octave\_spectral\_level\_demo.

## Arbritary-Crossover Filter-Banks and Spectrum Analyzers

These are similar to the Mth-octave analyzers above, except that the band-split frequencies are passed explicitly as arguments.

#### analyzer

Analyzer.

#### Usage

```
_ : analyzer(0,freqs) : par(i,N,_); // No delay equalizer
```

Where:

- 0: band-split filter order (ODD integer required for filterbank[i])
- freqs: (fc1,fc2,...,fcNs) [in numerically ascending order], where Ns=N-1 is the number of octave band-splits (total number of bands N=Ns+1).

If frequencies are listed explicitly as arguments, enclose them in parens:

```
_ : analyzer(3,(fc1,fc2)) : _,_,_
```

#### amp\_follower\_ar

Envelope follower with independent attack and release times. The release can be shorter than the attack (unlike in amp\_follower\_ud above).

#### Usage

```
_ : amp_follower_ar(att,rel) : _;
```

• Author Jonatan Liljedahl, revised by RM

# basics.lib

A library of basic elements for Faust organized in 5 sections:

- Conversion Tools
- Counters and Time/Tempo Tools
- Array Processing/Pattern Matching
- Selectors (Conditions)
- Other Tools (Misc)

The official prefix of this library is ba.

## **Conversion Tools**

#### samp2sec

Converts a number of samples to a duration in seconds. samp2sec is a standard Faust function.

# Usage samp2sec(n) : \_ Where: • n: number of samples sec2samp Converts a duration in seconds to a number of samples. samp2sec is a standard Faust function. Usage sec2samp(d) : \_ Where: • d: duration in seconds

db2linear	
Converts a loudness in $dB$ to a linear gain (0-1). $db2linear$ is a standard Fau function.	ust
Usage	

db2linear(1) : \_
Where:

• 1: loudness in dB

#### linear2db

Converts a linear gain (0-1) to a loudness in dB. linear2db is a standard Faust function.

### Usage

linear2db(g) : \_

Where:

• g: a linear gain

## lin2LogGain

Converts a linear gain (0-1) to a log gain (0-1).

#### Usage

\_ : lin2LogGain : \_

log2LinGain
Converts a log gain (0-1) to a linear gain (0-1).
$\mathbf{U}\mathbf{sage}$
_ : log2LinGain : _
tau2pole
Returns a real pole giving exponential decay. Note that t60 (time to decay 60 dB) is ~6.91 time constants. tau2pole is a standard Faust function.
Usage
_ : smooth(tau2pole(tau)) : _
Where:
• tau: time-constant in seconds
pole2tau
Returns the time-constant, in seconds, corresponding to the given real, positive pole in $(0,1)$ . pole2tau is a standard Faust function.
Usage
pole2tau(pole) : _
Where:

• pole: the pole

# midikey2hz

Converts a MIDI key number to a frequency in Hz (MIDI key 69 =	· A440).
midikey2hz is a standard Faust function.	

Usage
midikey2hz(mk) : _
Where:
• mk: the MIDI key number
pianokey2hz
Converts a piano key number to a frequency in Hz (piano key $49 = A440$ ).
Usage
pianokey2hz(pk) : _
Where:
• pk: the piano key number
hz2pianokey
Converts a frequency in Hz to a piano key number (piano key $49 = A440$ ).
Usage
hz2pianokey(f) : _
Where:
• f: frequency in Hz

## Counters and Time/Tempo Tools

#### countdown

Starts counting down from n included to 0. While trig is 1 the output is n. The countdown starts with the transition of trig from 1 to 0. At the end of the countdown the output value will remain at 0 until the next trig. countdown is a standard Faust function.

#### Usage

```
countdown(n,trig) : _
```

#### Where:

- count: the starting point of the countdown
- trig: the trigger signal (1: start at n; 0: decrease until 0)

#### countup

Starts counting up from 0 to n included. While trig is 1 the output is 0. The countup starts with the transition of trig from 1 to 0. At the end of the countup the output value will remain at n until the next trig. countup is a standard Faust function.

#### Usage

```
countup(n,trig) : _
```

#### Where:

- count: the starting point of the countup
- trig: the trigger signal (1: start at 0; 0: increase until n)

#### sweep

Counts from 0 to period samples repeatedly, while run is 1. Outsputs zero while run is 0.

Usage	
<pre>sweep(period,run) : _</pre>	
time	-
A simple timer that counts every samples from the beginning time is a standard Faust function.	of the process.
Usage	
time : _	
tempo	
Converts a tempo in BPM into a number of samples.	
Usage	
tempo(t) : _	
Where:	
• t: tempo in BPM	
	-
period	
Basic sawtooth wave of period p.	
Usage	
period(p) : _	
Where:	
• p: period as a number of samples	

pulse
Pulses (10000) generated at period p.
Usage
<pre>pulse(p) : _</pre>
Where:
• p: period as a number of samples
pulsen
Pulses (11110000) of length n generated at period p.
Usage
<pre>pulsen(n,p) : _</pre>
Where:
<ul> <li>n: the length of the pulse as a number of samples</li> <li>p: period as a number of samples</li> </ul>
beat
Pulses at tempo t. beat is a standard Faust function.
Usage
beat(t) : _
Where:
• t: tempo in BPM

## pulse\_countup

Starts counting up pulses. While trig is 1 the output is counting up, while trig is 0 the counter is reset to 0.

## Usage

```
_ : pulse_countup(trig) : _
```

#### Where:

• trig: the trigger signal (1: start at next pulse; 0: reset to 0)

#### pulse\_countdown

Starts counting down pulses. While trig is 1 the output is counting down, while trig is 0 the counter is reset to 0.

## Usage

```
_ : pulse_countdown(trig) : _
```

#### Where:

• trig: the trigger signal (1: start at next pulse; 0: reset to 0)

## pulse\_countup\_loop

Starts counting up pulses from 0 to n included. While trig is 1 the output is counting up, while trig is 0 the counter is reset to 0. At the end of the countup (n) the output value will be reset to 0.

```
_ : pulse_countup_loop(n,trig) : _
```

#### Where:

- n: the highest number of the countup (included) before reset to 0.
- trig: the trigger signal (1: start at next pulse; 0: reset to 0)

## pulse\_countdown\_loop

Starts counting down pulses from 0 to n included. While trig is 1 the output is counting down, while trig is 0 the counter is reset to 0. At the end of the countdown (n) the output value will be reset to 0.

## Usage

```
_ : pulse_coundown_loop(n,trig) : _
```

#### Where:

- n: the highest number of the countup (included) before reset to 0.
- trig: the trigger signal (1: start at next pulse; 0: reset to 0)

## Array Processing/Pattern Matching

## count

Count the number of elements of list l. count is a standard Faust function.

## Usage

```
count(1)
count ((10,20,30,40)) -> 4
```

#### Where:

• 1: list of elements

#### take

Take an element from a list. take is a standard Faust function.

## Usage

```
take(e,1)
take(3,(10,20,30,40)) -> 30
```

## Where:

- p: position (starting at 1)
- 1: list of elements

## subseq

Extract a part of a list.

## Usage

```
subseq(1, p, n)
subseq((10,20,30,40,50,60), 1, 3) -> (20,30,40)
subseq((10,20,30,40,50,60), 4, 1) -> 50
```

## Where:

- 1: list
- p: start point (0: begin of list)
- n: number of elements

**Note:** Faust doesn't have proper lists. Lists are simulated with parallel compositions and there is no empty list

## Selectors (Conditions)

#### if

if-then-else implemented with a select2.

• if(c, t, e) : \_

#### Where:

- c: condition
- t: signal selected while c is true
- e: signal selected while c is false

\_\_\_\_

#### selector

Selects the ith input among n at compile time.

## Usage

#### Where:

- i: input to select (int, numbered from 0, known at compile time)
- n: number of inputs (int, known at compile time, n > i)

#### selectn

Selects the ith input among N at run time.

## Usage

```
\label{eq:selectn(N,i)} $$\_,\_,\_,\_: selectn(4,2) : \_ // selects the 3rd input among 4
```

#### Where:

- N: number of inputs (int, known at compile time, N > 0)
- i: input to select (int, numbered from 0)

# Example test program N=64;process = par(n,N, (par(i,N,i) : selectn(N,n)));select2stereo Select between 2 stereo signals. Usage \_,\_,\_: select2stereo(bpc) : \_,\_,\_, Where: • bpc: the selector switch (0/1)Other latch Latch input on positive-going transition of "clock" ("sample-and-hold"). Usage \_ : latch(clocksig) : \_ Where: • clocksig: hold trigger (0 for hold, 1 for bypass)

## sAndH

Sample And Hold.  ${\tt sAndH}$  is a standard Faust function.

# Usage \_ : sAndH(t) : \_ Where: • t: hold trigger (0 for hold, 1 for bypass) downSample Down sample a signal. WARNING: this function doesn't change the rate of a signal, it just holds samples... downSample is a standard Faust function. Usage \_ : downSample(freq) : \_ Where: • freq: new rate in Hz peakhold Outputs current max value above zero. Usage \_ : peakhold(mode) : \_; Where: ${\tt mode}$ means: 0 - Pass through. A single sample 0 trigger will work as a reset. 1 -Track and hold max value.

## peakholder

Tracks abs peak and holds peak for 'holdtime' samples.

#### Usage

```
_ : peakholder(holdtime) : _;
```

## impulsify

Turns the signal from a button into an impulse  $(1,0,0,\ldots)$  when button turns on). impulsify is a standard Faust function.

## Usage

```
button("gate") : impulsify ;
```

#### automat

Record and replay to the values the input signal in a loop.

## Usage

```
hslider(...) : automat(bps, size, init) : _
```

#### bpf

bpf is an environment (a group of related definitions) that can be used to create break-point functions. It contains three functions :

- start(x,y) to start a break-point function
- end(x,y) to end a break-point function
- $\bullet\,$  point(x,y) to add intermediate points to a break-point function

A minimal break-point function must contain at least a start and an end point :

```
f = bpf.start(x0,y0) : bpf.end(x1,y1);
```

A more involved break-point function can contains any number of intermediate points:

```
f = bpf.start(x0,y0) : bpf.point(x1,y1) : bpf.point(x2,y2) : bpf.end(x3,y3);
```

In any case the  $x_{i}$  must be in increasing order (for all  $i, x_{i} < x_{i+1}$ ). For example the following definition :

```
f = bpf.start(x0,y0) : ... : bpf.point(xi,yi) : ... : bpf.end(xn,yn);
```

implements a break-point function f such that :

- $f(x) = y_{0} \text{ when } x < x_{0}$
- $f(x) = y_{n} \text{ when } x > x_{n}$
- f(x) = y\_{i} + (y\_{i+1}-y\_{i})\*(x-x\_{i})/(x\_{i+1}-x\_{i}) when x\_{i} <= x and x < x\_{i+1}

bpf is a standard Faust function.

bypass1

Takes a mono input signal, route it to e and bypass it if bpc = 1. bypass1 is a standard Faust function.

Usage

\_ : bypass1(bpc,e) : \_

Where:

- bpc: bypass switch (0/1)
- e: a mono effect

## bypass2

Takes a stereo input signal, route it to e and bypass it if bpc = 1. bypass2 is a standard Faust function.

## Usage

```
_,_ : bypass2(bpc,e) : _,_
```

Where:

- bpc: bypass switch (0/1)
- e: a stereo effect

## toggle

Triggered by the change of 0 to 1, it toggles the output value between 0 and 1.

## Usage

```
_ : toggle : _
```

## Examples

```
button("toggle") : toggle : vbargraph("output", 0, 1)
(an.amp_follower(0.1) > 0.01) : toggle : vbargraph("output", 0, 1) // takes audio input
```

\_\_\_\_

## on\_and\_off

The first channel set the output to 1, the second channel to 0.

## Usage

```
_ , _ : on_and_off : _
```

## Example

```
button("on"), button("off") : on_and_off : vbargraph("output", 0, 1)
```

#### selectoutn

Route input to the output among N at run time.

#### Usage

```
_ : selectoutn(n, s) : _,_,...n
```

#### Where:

- n: number of outputs (int, known at compile time, N > 0)
- s: output number to route to (int, numbered from 0) (i.e. slider)

#### Example

```
process = 1 : selectoutn(3, sel) : par(i,3,bar) ;
sel = hslider("volume",0,0,2,1) : int;
bar = vbargraph("v.bargraph", 0, 1);
```

# ${\bf compressors.lib}$

A library of compressor effects. Its official prefix is co.

## **Functions Reference**

#### compressor\_mono

Mono dynamic range compressors. compressor\_mono is a standard Faust function

```
_ : compressor_mono(ratio,thresh,att,rel) : _
```

#### Where:

- ratio: compression ratio (1 = no compression, >1 means compression)
- thresh: dB level threshold above which compression kicks in (0 dB = max level)
- att: attack time = time constant (sec) when level & compression going up
- rel: release time = time constant (sec) coming out of compression

#### References

- http://en.wikipedia.org/wiki/Dynamic\_range\_compression
- https://ccrma.stanford.edu/~jos/filters/Nonlinear\_Filter\_Example\_ Dynamic.html
- Albert Graef's "faust2pd"/examples/synth/compressor\_.dsp
- More features: https://github.com/magnetophon/faustCompressors

#### compressor\_stereo

Stereo dynamic range compressors.

#### Usage

```
_,_ : compressor_stereo(ratio,thresh,att,rel) : _,_
```

## Where:

- ratio: compression ratio (1 = no compression, >1 means compression)
- thresh: dB level threshold above which compression kicks in (0 dB = max level)
- att: attack time = time constant (sec) when level & compression going up
- rel: release time = time constant (sec) coming out of compression

- Albert Graef's "faust2pd"/examples/synth/compressor\_.dsp
- More features: https://github.com/magnetophon/faustCompressors

#### limiter\_1176\_R4\_mono

A limiter guards against hard-clipping. It can be can be implemented as a compressor having a high threshold (near the clipping level), fast attack and release, and high ratio. Since the ratio is so high, some knee smoothing is desirable ("soft limiting"). This example is intended to get you started using compressor\_\* as a limiter, so all parameters are hardwired to nominal values here. Ratios: 4 (moderate compression), 8 (severe compression), 12 (mild limiting), or 20 to 1 (hard limiting) Att: 20-800 MICROseconds (Note: scaled by ratio in the 1176) Rel: 50-1100 ms (Note: scaled by ratio in the 1176) Mike Shipley likes 4:1 (Grammy-winning mixer for Queen, Tom Petty, etc.) Faster attack gives "more bite" (e.g. on vocals) He hears a bright, clear eq effect as well (not implemented here) limiter\_1176\_R4\_mono is a standard Faust function.

#### Usage

```
_ : limiter_1176_R4_mono : _;
```

Reference: http://en.wikipedia.org/wiki/1176 Peak Limiter

## limiter\_1176\_R4\_stereo

A limiter guards against hard-clipping. It can be can be implemented as a compressor having a high threshold (near the clipping level), fast attack and release, and high ratio. Since the ratio is so high, some knee smoothing is desirable ("soft limiting"). This example is intended to get you started using compressor\_\* as a limiter, so all parameters are hardwired to nominal values here. Ratios: 4 (moderate compression), 8 (severe compression), 12 (mild limiting), or 20 to 1 (hard limiting) Att: 20-800 MICROseconds (Note: scaled by ratio in the 1176) Rel: 50-1100 ms (Note: scaled by ratio in the 1176) Mike Shipley likes 4:1

(Grammy-winning mixer for Queen, Tom Petty, etc.) Faster attack gives "more bite" (e.g. on vocals) He hears a bright, clear eq effect as well (not implemented here)

## Usage

```
_,_ : limiter_1176_R4_stereo : _,_;
```

 $\textbf{Reference:} \quad \text{http://en.wikipedia.org/wiki/1176\_Peak\_Limiter}$ 

# delays.lib

This library contains a collection of delay functions. Its official prefix is de.

## **Basic Delay Functions**

#### delay

Simple d samples delay where n is the maximum delay length as a number of samples (it needs to be a power of 2). Unlike the @ delay operator, this function allows to preallocate memory which means that d can be changed dynamically at run time as long as it remains smaller than n. delay is a standard Faust function.

#### Usage

```
_ : delay(n,d) : _
```

## Where:

- n: the max delay length as a power of 2
- d: the delay length as a number of samples (integer)

#### fdelay

Simple  $\tt d$  samples fractional delay based on 2 interpolated delay lines where  $\tt n$  is the maximum delay length as a number of samples (it needs to be a power of 2 - see  $\tt delay(\tt)$ ).  $\tt fdelay$  is a standard Faust function.

```
_ : fdelay(n,d) : _
```

#### Where:

- n: the max delay length as a power of 2
- d: the delay length as a number of samples (float)

## sdelay

s(mooth)delay: a mono delay that doesn't click and doesn't transpose when the delay time is changed.

## Usage

```
_ : sdelay(N,it,dt) : _
```

#### Where:

- N: maximal delay in samples (must be a constant power of 2, for example 65536)
- it: interpolation time (in samples) for example 1024
- dt: delay time (in samples)

## Lagrange Interpolation

## fdelaylti and fdelayltv

Fractional delay line using Lagrange interpolation.

## Usage

```
_ : fdelaylt[i|v](order, maxdelay, delay, inputsignal) : _
```

Where order=1,2,3,... is the order of the Lagrange interpolation polynomial.

fdelaylti is most efficient, but designed for constant/slowly-varying delay. fdelayltv is more expensive and more robust when the delay varies rapidly.

NOTE: The requested delay should not be less than (N-1)/2.

## References

- https://ccrma.stanford.edu/~jos/pasp/Lagrange\_Interpolation.html

- Philippe Depalle and Stephan Tassart, "Fractional Delay Lines using Lagrange Interpolators", ICMC Proceedings, pp. 341-343, 1996.

\_\_\_\_\_

## fdelay[n]

For convenience, fdelay1, fdelay2, fdelay3, fdelay4, fdelay5 are also available where n is the order of the interpolation.

\_\_\_\_

## Thiran Allpass Interpolation

Thiran Allpass Interpolation

 $\label{lem:reference} \textbf{Reference} \quad \text{https://ccrma.stanford.edu/$^{\circ}$jos/pasp/Thiran\_Allpass\_Interpolators.html}$ 

## fdelay[n]a

Delay lines interpolated using Thiran allpass interpolation.

## Usage

```
_ : fdelay[N]a(maxdelay, delay, inputsignal) : _ (exactly like fdelay)
Where:
```

• N=1,2,3, or 4 is the order of the Thiran interpolation filter, and the delay argument is at least N - 1/2.

Note The interpolated delay should not be less than N-1/2. (The allpass delay ranges from N-1/2 to N+1/2.) This constraint can be alleviated by altering the code, but be aware that allpass filters approach zero delay by means of pole-zero cancellations. The delay range [N-1/2,N+1/2] is not optimal. What is?

Delay arguments too small will produce an UNSTABLE allpass!

Because allpass interpolation is recursive, it is not as robust as Lagrange interpolation under time-varying conditions. (You may hear clicks when changing the delay rapidly.)

First-order allpass interpolation, delay d in [0.5,1.5]

## demos.lib

This library contains a set of demo functions based on examples located in the /examples folder. Its official prefix is dm.

## Analyzers

```
mth_octave_spectral_level_demo
```

Demonstrate mth octave spectral level in a standalone GUI.

## Usage

```
_ : mth_octave_spectral_level_demo(BandsPerOctave);
_ : spectral_level_demo : _; // 2/3 octave
```

## **Filters**

## parametric\_eq\_demo

A parametric equalizer application.

# Usage: \_ : parametric\_eq\_demo : \_ ; spectral\_tilt\_demo A spectral tilt application. Usage \_ : spectral\_tilt\_demo(N) : \_ ; Where: • N: filter order (integer) All other parameters interactive ${\tt mth\_octave\_filterbank\_demo} \ \ {\tt and} \ \ {\tt filterbank\_demo}$ Graphic Equalizer: Each filter-bank output signal routes through a fader. Usage \_ : mth\_octave\_filterbank\_demo(M) : \_ \_ : filterbank\_demo : \_ Where:

## **Effects**

cubicnl\_demo

Distortion demo application.

• N: number of bands per octave

```
Usage:
_ : cubicnl_demo : _;
gate_demo
Gate demo application.
Usage
_,_ : gate_demo : _,_;
compressor_demo
Compressor demo application.
Usage
_,_ : compressor_demo : _,_;
moog_vcf_demo
Illustrate and compare all three Moog VCF implementations above.
Usage
_ : moog_vcf_demo : _;
```

 $\mathtt{wah4\_demo}$ 

Wah pedal application.

```
_ : wah4_demo : _;
```

crybaby\_demo

Crybaby effect application.

## Usage

```
_ : crybaby_demo : _ ;
```

flanger\_demo

Flanger effect application.

## Usage

```
_,_ : flanger_demo : _,_;
```

phaser2\_demo

Phaser effect demo application.

## Usage

```
_,_ : phaser2_demo : _,_;
```

stereo\_reverb\_tester

Handy test inputs for reverberator demos below.

```
_ : stereo_reverb_tester : _
```

## fdnrev0\_demo

A reverb application using fdnrev0.

## Usage

```
_,_ : fdnrev0_demo(N,NB,BBSO) : _,_
```

#### Where:

- n: Feedback Delay Network (FDN) order / number of delay lines used = order of feedback matrix / 2, 4, 8, or 16 [extend primes array below for 32, 64, . . . ]
- nb: Number of frequency bands / Number of (nearly) independent T60 controls / Integer 3 or greater
- bbso = Butterworth band-split order / order of lowpass/highpass bandsplit used at each crossover freq / odd positive integer

#### zita\_rev\_fdn\_demo

Reverb demo application based on zita\_rev\_fdn.

## Usage

```
si.bus(8) : zita_rev_fdn_demo : si.bus(8)
```

## zita\_rev1

Example GUI for zita\_rev1\_stereo (mostly following the Linux zita-rev1 GUI).

Only the dry/wet and output level parameters are "dezippered" here. If parameters are to be varied in real time, use  ${\tt smooth(0.999)}$  or the like in the same way.

```
Usage
_,_ : zita_rev1 : _,_
\textbf{Reference} \quad \text{http://www.kokkinizita.net/linuxaudio/zita-rev1-doc/quickguide.}
Generators
sawtooth_demo
An application demonstrating the different sawtooth oscillators of Faust.
Usage
sawtooth_demo : _
virtual_analog_oscillator_demo
Virtual analog oscillator demo application.
Usage
virtual_analog_oscillator_demo : _
oscrs_demo
Simple application demoing filter based oscillators.
Usage
oscrs_demo : _
```

## velvet\_noise\_demo

Listen to velvet\_noise!

## Usage

```
velvet_noise_demo : _
```

## latch\_demo

Illustrate latch operation

## Usage

```
echo 'import("stdfaust.lib");' > latch_demo.dsp
echo 'process = dm.latch_demo;' >> latch_demo.dsp
faust2octave latch_demo.dsp
Octave:1> plot(faustout);
```

#### envelopes\_demo

Illustrate various envelopes overlaid

## Usage

```
echo 'import("stdfaust.lib");' > envelopes_demo.dsp
echo 'process = dm.envelopes_demo;' >> envelopes_demo.dsp
faust2octave envelopes_demo.dsp
Octave:1> plot(faustout);
```

#### exciter

Psychoacoustic harmonic exciter, with GUI.

```
_ : exciter : _
```

## References

- https://secure.aes.org/forum/pubs/ebriefs/?elib=16939
- $\bullet \ \, \text{https://www.researchgate.net/publication/258333577\_Modeling\_the\_Harmonic\_Exciter} \\$

vocoder\_demo

Use example of the vocoder function where an impulse train is used as excitation.

#### Usage

```
_ : vocoder_demo : _;
```

## freeverb\_demo

Freeverb demo application.

## Usage

```
_,_ : freeverb_demo : _,_;
```

# envelopes.lib

This library contains a collection of envelope generators. Its official prefix is en.

## **Functions Reference**

## smoothEnvelope

An envelope with an exponential attack and release. smoothEnvelope is a standard Faust function.

#### Usage

smoothEnvelope(ar,t) : \_

- ar: attack and release duration (s)
- t: trigger signal (0-1)

ar

AR (Attack, Release) envelope generator (useful to create percussion envelopes). ar is a standard Faust function.

## Usage

```
ar(a,r,t) : _
```

Where:

- a: attack (sec)
- r: release (sec)
- t: trigger signal (0 or 1)

asr

ASR (Attack, Sustain, Release) envelope generator. asr is a standard Faust function.

 $asr(a,s,r,g) : _$ 

Where:

- a, s, r: attack (sec), sustain (percentage of g), release (sec)
- g: trigger signal (>0 for attack, then release is when g back to 0)

#### adsr

ADSR (Attack, Decay, Sustain, Release) envelope generator. adsr is a standard Faust function.

#### Usage

adsr(a,d,s,r,g) : \_

Where:

- a, d, s, r: attack (sec), decay (sec), sustain level (percentage of max), release (sec)
- g: gate signal (>0 for attack, then release is when g back to 0)

#### adsre

ADSRE (Attack, Decay, Sustain, Release) envelope generator with Exponential segments. adsre is a standard Faust function.

#### Usage

adsre(a,d,s,r,g) : \_

Where:

- a, d, s, r: attack (sec), decay (sec), sustain level (percentage of max), release (sec)
- g: gate signal (>0 for attack, then release is when g back to 0)

## filters.lib

Faust Filters library; Its official prefix is fi.

The Filters library is organized into 18 sections:

- Basic Filters
- Comb Filters
- Direct-Form Digital Filter Sections
- Direct-Form Second-Order Biquad Sections
- Ladder/Lattice Digital Filters
- Useful Special Cases
- Ladder/Lattice Allpass Filters
- Digital Filter Sections Specified as Analog Filter Sections
- Simple Resonator Filters
- Butterworth Lowpass/Highpass Filters
- Special Filter-Bank Delay-Equalizing Allpass Filters
- Elliptic (Cauer) Lowpass Filters
- Elliptic Highpass Filters
- Butterworth Bandpass/Bandstop Filters
- Elliptic Bandpass Filters
- Parametric Equalizers (Shelf, Peaking)
- Mth-Octave Filter-Banks
- Arbritary-Crossover Filter-Banks and Spectrum Analyzers

For more information, see ../documentation/library.pdf

#### **Basic Filters**

#### zero

One zero filter. Difference equation: y(n) = x(n) - z \* x(n-1).

#### Usage

```
_ : zero(z) : _
```

#### Where:

• z: location of zero along real axis in z-plane

Reference <a href="https://ccrma.stanford.edu/~jos/filters/One\_Zero.html">https://ccrma.stanford.edu/~jos/filters/One\_Zero.html</a>

pole

One pole filter. Could also be called a "leaky integrator". Difference equation: y(n) = x(n) + p \* y(n-1).

Usage

\_ : pole(z) : \_

Where:

• p: pole location = feedback coefficient

Reference <a href="https://ccrma.stanford.edu/~jos/filters/One\_Pole.html">https://ccrma.stanford.edu/~jos/filters/One\_Pole.html</a>

integrator

Same as pole(1) [implemented separately for block-diagram clarity].

#### dcblockerat

DC blocker with configurable break frequency. The amplitude response is substantially flat above fb, and sloped at about +6 dB/octave below fb. Derived from the analog transfer function H(s) = s / (s + 2PIfb) by the low-frequency-matching bilinear transform method (i.e., the standard frequency-scaling constant 2\*SR).

#### Usage

```
_ : dcblockerat(fb) : _
```

Where:

• fb: "break frequency" in Hz, i.e., -3 dB gain frequency.

Reference html	$https://ccrma.stanford.edu/{\sim}jos/pasp/Bilinear\_Transformation.\\$	
high-frequence Faust function	Default dc blocker has -3dB point near 35 Hz (at 44.1 kHz) and cy gain near 1.0025 (due to no scaling). dcblocker is as standard n.	
Usage	er : _	
Comb Fil	ters	
ff_comb		
Feed-Forward Comb Filter. Note that ff_comb requires integer delays (uses delay internally). ff_comb is a standard Faust function.		
Usage		
_ : ff_comb	(maxdel,intdel,b0,bM) : _	
Where:		
<ul><li>intdel</li><li>del: cu</li><li>b0: gain</li></ul>	: maximum delay (a power of 2) : current (integer) comb-filter delay between 0 and maxdel :rrent (float) comb-filter delay between 0 and maxdel in applied to delay-line input in applied to delay-line output and then summed with input	
Reference Filters.html	$https://ccrma.stanford.edu/{\sim}jos/pasp/Feedforward\_Comb\_$	

## ff\_fcomb

Feed-Forward Comb Filter. Note that ff\_fcomb takes floating-point delays (uses fdelay internally). ff\_fcomb is a standard Faust function.

#### Usage

```
_ : ff_fcomb(maxdel,del,b0,bM) : _
```

#### Where:

- maxdel: maximum delay (a power of 2)
- intdel: current (integer) comb-filter delay between 0 and maxdel
- del: current (float) comb-filter delay between 0 and maxdel
- b0: gain applied to delay-line input
- bM: gain applied to delay-line output and then summed with input

 $\begin{tabular}{ll} \bf Reference & https://ccrma.stanford.edu/~jos/pasp/Feedforward\_Comb\_\\ Filters.html & \\ \end{tabular}$ 

#### ffcombfilter

Typical special case of  $ff_{comb}()$  where: b0 = 1.

#### fb\_comb

Feed-Back Comb Filter (integer delay).

## Usage

```
_ : fb_comb(maxdel,intdel,b0,aN) : _
```

#### Where:

- maxdel: maximum delay (a power of 2)
- intdel: current (integer) comb-filter delay between 0 and maxdel
- del: current (float) comb-filter delay between 0 and maxdel
- $\bullet\,$  b0: gain applied to delay-line input and forwarded to output
- aN: minus the gain applied to delay-line output before summing with the input and feeding to the delay line

Reference http html	ps://ccrma.stanford.edu/~jos/pasp/Feedback_Comb_Filters
fb_fcomb	
Feed-Back Comb	Filter (floating point delay).
Usage	
_ : fb_fcomb(ma	axdel,del,b0,aN) : _
Where:	
<ul> <li>intdel: cur</li> <li>del: curren</li> <li>b0: gain ap</li> <li>aN: minus t</li> <li>input and fe</li> </ul> Reference http	aximum delay (a power of 2) rrent (integer) comb-filter delay between 0 and maxdel at (float) comb-filter delay between 0 and maxdel plied to delay-line input and forwarded to output he gain applied to delay-line output before summing with the deeding to the delay line ps://ccrma.stanford.edu/~jos/pasp/Feedback_Comb_Filters
html	
rev1	
	b_comb (rev1(maxdel,N,g)). The "rev1 section" dates back imputer-music reverberation. See the jcrev and brassrev in usage examples.
fbcombfilter an	nd ffbcombfilter

Other special cases of Feed-Back Comb Filter.

```
_ : fbcombfilter(maxdel,intdel,g) : _
_ : ffbcombfilter(maxdel,del,g) : _
```

#### Where:

- maxdel: maximum delay (a power of 2)
- intdel: current (integer) comb-filter delay between 0 and maxdel
- del: current (float) comb-filter delay between 0 and maxdel
- g: feedback gain

 $\label{lem:reference} \textbf{Reference} \quad \text{https://ccrma.stanford.edu/} \\ \sim \text{jos/pasp/Feedback\_Comb\_Filters.} \\ \text{html}$ 

#### allpass\_comb

Schroeder Allpass Comb Filter. Note that

```
allpass_comb(maxlen,len,aN) = ff_comb(maxlen,len,aN,1) : fb_comb(maxlen,len-1,1,aN);
```

which is a direct-form-1 implementation, requiring two delay lines. The implementation here is direct-form-2 requiring only one delay line.

#### Usage

```
_ : allpass_comb (maxdel,intdel,aN) : _
```

#### Where:

- maxdel: maximum delay (a power of 2)
- intdel: current (integer) comb-filter delay between 0 and maxdel
- del: current (float) comb-filter delay between 0 and maxdel
- $\bullet\,$  a<br/>N: minus the feedback gain

#### References

- $https://ccrma.stanford.edu/\sim jos/pasp/Allpass\_Two\_Combs.html$
- https://ccrma.stanford.edu/~jos/pasp/Schroeder\_Allpass\_Sections.html
- https://ccrma.stanford.edu/~jos/filters/Four\_Direct\_Forms.html

## allpass\_fcomb

Schroeder Allpass Comb Filter. Note that

```
allpass_comb(maxlen,len,aN) = ff_comb(maxlen,len,aN,1) : fb_comb(maxlen,len-1,1,aN);
```

which is a direct-form-1 implementation, requiring two delay lines. The implementation here is direct-form-2 requiring only one delay line.

allpass\_fcomb is a standard Faust library.

#### Usage

```
_ : allpass_comb (maxdel,intdel,aN) : _
_ : allpass_fcomb(maxdel,del,aN) : _
```

#### Where:

- maxdel: maximum delay (a power of 2)
- intdel: current (float) comb-filter delay between 0 and maxdel
- del: current (float) comb-filter delay between 0 and maxdel
- aN: minus the feedback gain

#### References

- $https://ccrma.stanford.edu/\sim jos/pasp/Allpass\_Two\_Combs.html$
- https://ccrma.stanford.edu/~jos/pasp/Schroeder\_Allpass\_Sections.html
- $\bullet \ \, https://ccrma.stanford.edu/~jos/filters/Four\_Direct\_Forms.html$

rev2

Special case of allpass\_comb (rev2(maxlen,len,g)). The "rev2 section" dates back to the 1960s in computer-music reverberation. See the jcrev and brassrev in reverbs.lib for usage examples.

## allpass\_fcomb5 and allpass\_fcomb1a

Same as allpass\_fcomb but use fdelay5 and fdelay1a internally (Interpolation helps - look at an fft of faust2octave on

```
`1-1' <: allpass_fcomb(1024,10.5,0.95), allpass_fcomb5(1024,10.5,0.95); `).
```

## **Direct-Form Digital Filter Sections**

iir

Nth-order Infinite-Impulse-Response (IIR) digital filter, implemented in terms of the Transfer-Function (TF) coefficients. Such filter structures are termed "direct form".

iir is a standard Faust function.

## Usage

```
_ : iir(bcoeffs,acoeffs) : _
```

Where:

- order: filter order (int) = max(#poles,#zeros)
- bcoeffs:  $(b0,b1,...,b\_order) = TF$  numerator coefficients
- acoeffs: (a1,...,a\_order) = TF denominator coeffs (a0=1)

 $\label{lem:reference} \textbf{Reference} \quad \text{https://ccrma.stanford.edu/$\sim$jos/filters/Four\_Direct\_Forms.} \\ \text{html}$ 

fir

FIR filter (convolution of FIR filter coefficients with a signal)

```
_ : fir(bv) : _
```

fir is standard Faust function.

Where:

• bv = b0, b1, ..., bn is a parallel bank of coefficient signals.

**Note** by is processed using pattern-matching at compile time, so it must have this normal form (parallel signals).

**Example** Smoothing white noise with a five-point moving average:

```
bv = .2,.2,.2,.2;
process = noise : fir(bv);

Equivalent (note double parens):

process = noise : fir((.2,.2,.2,.2,.2));
```

## conv and convN

Convolution of input signal with given coefficients.

## Usage

```
_ : conv((k1,k2,k3,...,kN)) : _; // Argument = one signal bank
_ : convN(N,(k1,k2,k3,...)) : _; // Useful when N < count((k1,...))</pre>
```

tf1, tf2 and tf3

tfN = N'th-order direct-form digital filter.

```
_ : tf1(b0,b1,a1) : _
_ : tf2(b0,b1,b2,a1,a2) : _
_ : tf3(b0,b1,b2,b3,a1,a2,a3) : _
```

#### Where:

- a: the poles
- b: the zeros

 ${\bf Reference} \quad {\rm https://ccrma.stanford.edu/^{\hspace{-0.2cm}\sim}} jos/fp/Direct\_Form\_I.html$ 

\_\_\_\_

#### notchw

Simple notch filter based on a biquad (tf2). notchw is a standard Faust function.

## Usage:

```
_ : notchw(width,freq) : _
```

## Where:

- width: "notch width" in Hz (approximate)
- freq: "notch frequency" in Hz

 $\label{lem:reference} \begin{tabular}{ll} Reference & https://ccrma.stanford.edu/~jos/pasp/Phasing\_2nd\_Order\_Allpass\_Filters.html \\ \end{tabular}$ 

## **Direct-Form Second-Order Biquad Sections**

Direct-Form Second-Order Biquad Sections

 $\label{lem:reference} \textbf{Reference} \quad \text{https://ccrma.stanford.edu/$^{\circ}$jos/filters/Four\_Direct\_Forms.} \\ \text{html}$ 

### tf21, tf22, tf22t and tf21t

tfN = N'th-order direct-form digital filter where:

- tf21 is tf2, direct-form 1
- tf22 is tf2, direct-form 2
- tf22t is tf2, direct-form 2 transposed
- tf21t is tf2, direct-form 1 transposed

# Usage

```
_ : tf21(b0,b1,b2,a1,a2) : _
_ : tf22(b0,b1,b2,a1,a2) : _
_ : tf22t(b0,b1,b2,a1,a2) : _
_ : tf21t(b0,b1,b2,a1,a2) : _
```

### Where:

• a: the poles

• b: the zeros

Reference https://ccrma.stanford.edu/~jos/fp/Direct\_Form\_I.html

# Ladder/Lattice Digital Filters

Ladder and lattice digital filters generally have superior numerical properties relative to direct-form digital filters. They can be derived from digital waveguide filters, which gives them a physical interpretation.

#### av2sv

Compute reflection coefficients sv from transfer-function denominator av.

### Usage

```
sv = av2sv(av)
```

- av: parallel signal bank a1,...,aN
- sv: parallel signal bank s1,...,sN

where ro = ith reflection coefficient, and ai = coefficient of  $z^(-i)$  in the filter transfer-function denominator A(z).

Reference https://ccrma.stanford.edu/ $\sim$ jos/filters/Step\_Down\_Procedure. html (where reflection coefficients are denoted by k rather than s).

#### bvav2nuv

Compute lattice tap coefficients from transfer-function coefficients.

#### Usage

```
nuv = bvav2nuv(bv,av)
```

#### Where:

- av: parallel signal bank a1,...,aN
- bv: parallel signal bank b0,b1,...,aN
- nuv: parallel signal bank nu1,...,nuN

where nui is the i'th tap coefficient, bi is the coefficient of  $z^{(-i)}$  in the filter numerator, ai is the coefficient of  $z^{(-i)}$  in the filter denominator

# iir\_lat2

Two-multiply latice IIR filter or arbitrary order.

### Usage

```
_ : iir_lat2(bv,av) : _
```

- bv: zeros as a bank of parallel signals
- av: poles as a bank of parallel signals

# allpassnt

Two-multiply lattice allpass (nested order-1 direct-form-ii allpasses).

# Usage

```
_ : allpassnt(n,sv) : _
```

### Where:

- n: the order of the filter
- sv: the reflexion coefficients (-1 1)

iir\_kl

Kelly-Lochbaum ladder IIR filter or arbitrary order.

# Usage

```
_ : iir_kl(bv,av) : _
```

#### Where:

- $\bullet\,$  by: zeros as a bank of parallel signals
- av: poles as a bank of parallel signals

# allpassnklt

Kelly-Lochbaum ladder allpass.

# Usage:

```
_ : allpassklt(n,sv) : _
```

- n: the order of the filter
- sv: the reflexion coefficients (-1 1)

# iir\_lat1

One-multiply latice IIR filter or arbitrary order.

# Usage

```
_ : iir_lat1(bv,av) : _
```

#### Where:

- by: zeros as a bank of parallel signals
- av: poles as a bank of parallel signals

# allpassn1mt

One-multiply lattice allpass with tap lines.

# Usage

```
_ : allpassn1mt(n,sv) : _
```

#### Where:

- n: the order of the filter
- sv: the reflexion coefficients (-1 1)

# iir\_nl

Normalized ladder filter of arbitrary order.

# Usage

```
_ : iir_nl(bv,av) : _
```

- bv: zeros as a bank of parallel signals
- av: poles as a bank of parallel signals

### References

- J. D. Markel and A. H. Gray, Linear Prediction of Speech, New York: Springer Verlag, 1976.

### allpassnnlt

Normalized ladder allpass filter of arbitrary order.

### Usage:

```
_ : allpassnnlt(n,sv) : _
```

#### Where:

- n: the order of the filter
- sv: the reflexion coefficients (-1,1)

### References

- J. D. Markel and A. H. Gray, Linear Prediction of Speech, New York: Springer Verlag, 1976.

# **Useful Special Cases**

# tf2np

Biquad based on a stable second-order Normalized Ladder Filter (more robust to modulation than tf2 and protected against instability).

```
_ : tf2np(b0,b1,b2,a1,a2) : _
```

#### Where:

- a: the poles
- b: the zeros

#### wgr

Second-order transformer-normalized digital waveguide resonator.

# Usage

```
_ : wgr(f,r) : _
```

### Where:

- f: resonance frequency (Hz)
- r: loss factor for exponential decay (set to 1 to make a numerically stable oscillator)

# References

- https://ccrma.stanford.edu/~jos/pasp/Power\_Normalized\_Waveguide\_ Filters.html
- https://ccrma.stanford.edu/~jos/pasp/Digital\_Waveguide\_Oscillator. html

#### nlf2

Second order normalized digital waveguide resonator.

```
_{\tt}: nlf2(f,r) : _{\tt}
```

#### Where:

- f: resonance frequency (Hz)
- r: loss factor for exponential decay (set to 1 to make a sinusoidal oscillator)

**Reference** https://ccrma.stanford.edu/~jos/pasp/Power\_Normalized\_ Waveguide\_Filters.html

#### apnl

Passive Nonlinear Allpass based on Pierce switching springs idea. Switch between allpass coefficient a1 and a2 at signal zero crossings.

### Usage

```
_ : apnl(a1,a2) : _
```

# Where:

• a1 and a2: allpass coefficients

# Ladder/Lattice Allpass Filters

An allpass filter has gain 1 at every frequency, but variable phase. Ladder/lattice allpass filters are specified by reflection coefficients. They are defined here as nested allpass filters, hence the names allpassn\*.

### References

#### allpassn

Two-multiply lattice - each section is two multiply-adds.

# Usage:

```
_ : allpassn(n,sv) : _
```

#### Where:

- n: the order of the filter
- sv: the reflexion coefficients (-1 1)

### References

• J. O. Smith and R. Michon, "Nonlinear Allpass Ladder Filters in FAUST", in Proceedings of the 14th International Conference on Digital Audio Effects (DAFx-11), Paris, France, September 19-23, 2011.

# allpassnn

Normalized form - four multiplies and two adds per section, but coefficients can be time varying and nonlinear without "parametric amplification" (modulation of signal energy).

# Usage:

```
_ : allpassnn(n,tv) : _
```

- n: the order of the filter
- tv: the reflexion coefficients (-PI PI)

### allpasskl

Kelly-Lochbaum form - four multiplies and two adds per section, but all signals have an immediate physical interpretation as traveling pressure waves, etc.

# Usage:

```
_ : allpassnkl(n,sv) : _
```

#### Where:

- n: the order of the filter
- sv: the reflexion coefficients (-1 1)

\_\_\_\_\_

# allpass1m

One-multiply form - one multiply and three adds per section. Normally the most efficient in special-purpose hardware.

## Usage:

```
_ : allpassn1m(n,sv) : _
```

#### Where:

- n: the order of the filter
- sv: the reflexion coefficients (-1 1)

# Digital Filter Sections Specified as Analog Filter Sections

# tf2s and tf2snp

Second-order direct-form digital filter, specified by ANALOG transfer-function polynomials B(s)/A(s), and a frequency-scaling parameter. Digitization via the bilinear transform is built in.

Where:

and w1 is the desired digital frequency (in radians/second) corresponding to analog frequency 1 rad/sec (i.e., s = j).

**Example** A second-order ANALOG Butterworth lowpass filter, normalized to have cutoff frequency at 1 rad/sec, has transfer function

where a1 = sqrt(2). Therefore, a DIGITAL Butterworth lowpass cutting off at SR/4 is specified as tf2s(0,0,1,sqrt(2),1,PI\*SR/2);

Method Bilinear transform scaled for exact mapping of w1.

 $\label{lem:reference} \textbf{Reference} \quad \text{https://ccrma.stanford.edu/$^{\circ}$jos/pasp/Bilinear\_Transformation.} \\ \text{html}$ 

#### tf3s1f

Analogous to tf2s above, but third order, and using the typical low-frequency-matching bilinear-transform constant 2/T ("lf" series) instead of the specific-frequency-matching value used in tf2s and tf1s. Note the lack of a "w1" argument.

#### Usage

#### tf1s

First-order direct-form digital filter, specified by ANALOG transfer-function polynomials B(s)/A(s), and a frequency-scaling parameter.

## Usage

tf1s(b1,b0,a0,w1)

Where:

$$b1 s + b0$$

$$H(s) = ---- s + a0$$

and w1 is the desired digital frequency (in radians/second) corresponding to analog frequency 1 rad/sec (i.e., s = j).

 $\bf Example \,\,$  A first-order ANALOG Butterworth lowpass filter, normalized to have cutoff frequency at 1 rad/sec, has transfer function

1

$$H(s) = ----s + 1$$

so b0 = a0 = 1 and b1 = 0. Therefore, a DIGITAL first-order Butterworth lowpass with gain -3dB at SR/4 is specified as

tf1s(0,1,1,PI\*SR/2); // digital half-band order 1 Butterworth

Method Bilinear transform scaled for exact mapping of w1.

 $\label{lem:reference} \textbf{Reference} \quad \text{https://ccrma.stanford.edu/$^{\circ}$jos/pasp/Bilinear\_Transformation.} \\ \text{html}$ 

#### tf2sb

Bandpass mapping of tf2s: In addition to a frequency-scaling parameter w1 (set to HALF the desired passband width in rad/sec), there is a desired center-frequency parameter wc (also in rad/s). Thus, tf2sb implements a fourth-order digital bandpass filter section specified by the coefficients of a second-order analog lowpass prototpe section. Such sections can be combined in series for higher orders. The order of mappings is (1) frequency scaling (to set lowpass cutoff w1), (2) bandpass mapping to wc, then (3) the bilinear transform, with the usual scale parameter 2\*SR. Algebra carried out in maxima and pasted here.

## Usage

```
_ : tf2sb(b2,b1,b0,a1,a0,w1,wc) : _
```

#### tf1sb

First-to-second-order lowpass-to-bandpass section mapping, analogous to tf2sb above.

# Usage

```
_ : tf1sb(b1,b0,a0,w1,wc) : _
```

# Simple Resonator Filters

#### resonlp

Simple resonant lowpass filter based on tf2s (virtual analog). resonlp is a standard Faust function.

## Usage

```
_ : resonlp(fc,Q,gain) : _
_ : resonlp(fc,Q,gain) : _
_ : resonlp(fc,Q,gain) : _
```

### Where:

```
fc: center frequency (Hz)
Q: q
gain: gain (0-1)
```

### resonhp

Simple resonant highpass filters based on tf2s (virtual analog). resonhp is a standard Faust function.

## Usage

```
_ : resonlp(fc,Q,gain) : _
_ : resonhp(fc,Q,gain) : _
_ : resonbp(fc,Q,gain) : _
Where:
```

- fc: center frequency (Hz)
- Q: q
- gain: gain (0-1)

resonbp

Simple resonant bandpass filters based on tf2s (virtual analog). resonbp is a standard Faust function.

# Usage

```
_ : resonlp(fc,Q,gain) : _
_ : resonhp(fc,Q,gain) : _
_ : resonbp(fc,Q,gain) : _
```

- fc: center frequency (Hz)
- Q: q
- gain: gain (0-1)

# Butterworth Lowpass/Highpass Filters

### lowpass

Nth-order Butterworth lowpass filter. lowpass is a standard Faust function.

#### Usage

```
_ : lowpass(N,fc) : _
```

#### Where:

- N: filter order (number of poles) [nonnegative constant integer]
- fc: desired cut-off frequency (-3dB frequency) in Hz

#### References

- https://ccrma.stanford.edu/~jos/filters/Butterworth\_Lowpass\_Design.
- butter function in Octave ("[z,p,g] = butter(N,1,'s');")

# highpass

Nth-order Butterworth highpass filters. highpass is a standard Faust function.

#### Usage

```
_ : highpass(N,fc) : _
```

### Where:

- N: filter order (number of poles) [nonnegative constant integer]
- ${\tt fc} :$  desired cut-off frequency (-3dB frequency) in Hz

#### References

- https://ccrma.stanford.edu/~jos/filters/Butterworth\_Lowpass\_Design. html
- butter function in Octave ("[z,p,g] = butter(N,1,'s');")

### lowpass0\_highpass1

# Special Filter-Bank Delay-Equalizing Allpass Filters

These special allpass filters are needed by filterbank et al. below. They are equivalent to (lowpass(N,fc) + | - highpass(N,fc))/2, but with canceling polezero pairs removed (which occurs for odd N).

### lowpass\_plus|minus\_highpass

# Elliptic (Cauer) Lowpass Filters

Elliptic (Cauer) Lowpass Filters

#### References

- $\bullet \quad < http://en.wikipedia.org/wiki/Elliptic\_filter$
- functions neauer and ellip in Octave

### lowpass3e

Third-order Elliptic (Cauer) lowpass filter.

# Usage

```
_ : lowpass3e(fc) : _
```

#### Where:

• fc: -3dB frequency in Hz

**Design** For spectral band-slice level display (see octave\_analyzer3e):

```
[z,p,g] = ncauer(Rp,Rs,3); % analog zeros, poles, and gain, where Rp = 60 % dB ripple in stopband Rs = 0.2 % dB ripple in passband
```

### lowpass6e

Sixth-order Elliptic/Cauer lowpass filter.

### Usage

```
_ : lowpass6e(fc) : _
```

Where:

• fc: -3dB frequency in Hz

**Design** For spectral band-slice level display (see octave\_analyzer6e):

```
[z,p,g] = ncauer(Rp,Rs,6); % analog zeros, poles, and gain, where Rp = 80 % dB ripple in stopband Rs = 0.2 % dB ripple in passband
```

# Elliptic Highpass Filters

### highpass3e

Third-order Elliptic (Cauer) highpass filter. Inversion of lowpass3e wrt unit circle in s plane (s <- 1/s)

#### Usage

```
_ : highpass3e(fc) : _
```

Where:

• fc: -3dB frequency in Hz

\_\_\_\_\_

# highpass6e

Sixth-order Elliptic/Cauer highpass filter. Inversion of lowpass3e wrt unit circle in s plane (s <- 1/s)

```
_ : highpass6e(fc) : _
```

#### Where:

• fc: -3dB frequency in Hz

# Butterworth Bandpass/Bandstop Filters

#### bandpass

Order 2\*Nh Butterworth bandpass filter made using the transformation s <- s + wc^2/s on lowpass(Nh), where wc is the desired bandpass center frequency. The lowpass(Nh) cutoff w1 is half the desired bandpass width. bandpass is a standard Faust function.

# Usage

```
_ : bandpass(Nh,fl,fu) : _
```

#### Where:

- Nh: HALF the desired bandpass order (which is therefore even)
- fl: lower -3dB frequency in Hz
- fu: upper -3dB frequency in Hz Thus, the passband width is fu-f1, and its center frequency is (f1+fu)/2.

 ${\bf Reference} \quad {\rm http://cnx.org/content/m16913/latest/}$ 

# bandstop

Order 2\*Nh Butterworth bandstop filter made using the transformation s <- s + wc^2/s on highpass(Nh), where wc is the desired bandpass center frequency. The highpass(Nh) cutoff w1 is half the desired bandpass width. bandstop is a standard Faust function.

# 

# Parametric Equalizers (Shelf, Peaking)

Parametric Equalizers (Shelf, Peaking)

#### References

#### low\_shelf

First-order "low shelf" filter (gain boost|cut between dc and some frequency) low\_shelf is a standard Faust function.

#### Usage

```
_ : lowshelf(N,L0,fx) : _
_ : low_shelf(L0,fx) : _ // default case (order 3)
_ : lowshelf_other_freq(N,L0,fx) : _
```

Where: \* N: filter order 1, 3, 5, ... (odd only). (default should be 3) \* L0: desired level (dB) between dc and fx (boost L0>0 or cut L0<0) \* fx: -3dB frequency of lowpass band (L0>0) or upper band (L0<0) (see "SHELF SHAPE" below).

The gain at SR/2 is constrained to be 1. The generalization to arbitrary odd orders is based on the well known fact that odd-order Butterworth band-splits are allpass-complementary (see filterbank documentation below for references).

**Shelf Shape** The magnitude frequency response is approximately piecewise-linear on a log-log plot ("BODE PLOT"). The Bode "stick diagram" approximation L(lf) is easy to state in dB versus dB-frequency lf = dB(f):

- L0 > 0:
- L(lf) = L0, f between 0 and fx = 1st corner frequency;
- L(lf) = L0 N \* (lf lfx), f between fx and f2 = 2nd corner frequency;
- L(lf) = 0, lf > lf2.
- lf2 = lfx + L0/N = dB-frequency at which level gets back to 0 dB.
- L0 < 0:
- L(lf) = L0, f between 0 and f1 = 1st corner frequency;
- L(lf) = N \* (lfx lf), f between f1 and lfx = 2nd corner frequency;
- L(lf) = 0, lf > lfx.
- lf1 = lfx + L0/N = dB-frequency at which level goes up from L0.

See lowshelf\_other\_freq.

#### high\_shelf

First-order "high shelf" filter (gain boost|cut above some frequency). high\_shelf is a standard Faust function.

```
_ : highshelf(N,Lpi,fx) : _
_ : high_shelf(L0,fx) : _ // default case (order 3)
_ : highshelf_other_freq(N,Lpi,fx) : _
```

#### Where:

- N: filter order 1, 3, 5, ... (odd only).
- Lpi: desired level (dB) between fx and SR/2 (boost Lpi>0 or cut Lpi<0)
- fx: -3dB frequency of highpass band (L0>0) or lower band (L0<0) (Use highshelf\_other\_freq() below to find the other one.)

The gain at dc is constrained to be 1. See lowshelf documentation above for more details on shelf shape.

### peak\_eq

Second order "peaking equalizer" section (gain boost or cut near some frequency) Also called a "parametric equalizer" section. peak\_eq is a standard Faust function.

#### Usage

```
_ : peak_eq(Lfx,fx,B) : _;
```

# Where:

- Lfx: level (dB) at fx (boost Lfx>0 or cut Lfx<0)
- fx: peak frequency (Hz)
- B: bandwidth (B) of peak in Hz

### peak\_eq\_cq

Constant-Q second order peaking equalizer section.

```
_ : peak_eq_cq(Lfx,fx,Q) : _;
```

#### Where:

- Lfx: level (dB) at fx
- fx: boost or cut frequency (Hz)

#### peak\_eq\_rm

Regalia-Mitra second order peaking equalizer section

#### Usage

```
_ : peak_eq_rm(Lfx,fx,tanPiBT) : _;
```

#### Where:

- Lfx: level (dB) at fx
- fx: boost or cut frequency (Hz)
- tanPiBT: tan(PI\*B/SR), where B = -3dB bandwidth (Hz) when  $10^{(Lfx/20)} = 0 \sim PI*B/SR$  for narrow bandwidths B

**Reference** P.A. Regalia, S.K. Mitra, and P.P. Vaidyanathan, "The Digital All-Pass Filter: A Versatile Signal Processing Building Block" Proceedings of the IEEE, 76(1):19-37, Jan. 1988. (See pp. 29-30.)

\_\_\_\_

# spectral\_tilt

Spectral tilt filter, providing an arbitrary spectral rolloff factor alpha in (-1,1), where -1 corresponds to one pole (-6 dB per octave), and +1 corresponds to one zero (+6 dB per octave). In other words, alpha is the slope of the ln magnitude versus ln frequency. For a "pinking filter" (e.g., to generate 1/f noise from white noise), set alpha to -1/2.

```
_ : spectral_tilt(N,f0,bw,alpha) : _
```

#### Where:

- N: desired integer filter order (fixed at compile time)
- f0: lower frequency limit for desired roll-off band
- bw: bandwidth of desired roll-off band
- alpha: slope of roll-off desired in nepers per neper (ln mag / ln radian freq)

Examples See spectral\_tilt\_demo.

# levelfilter

Dynamic level lowpass filter. levelfilter is a standard Faust function.

### Usage

```
_ : levelfilter(L,freq) : _
```

#### Where:

- L: desired level (in dB) at Nyquist limit (SR/2), e.g., -60
- freq: corner frequency (-3dB point) usually set to fundamental freq
- N: Number of filters in series where L = L/N

**Reference** https://ccrma.stanford.edu/realsimple/faust\_strings/Dynamic\_ Level\_Lowpass\_Filter.html

#### levelfilterN

Dynamic level lowpass filter.

#### Usage

```
_ : levelfilterN(N,freq,L) : _
```

#### Where:

- L: desired level (in dB) at Nyquist limit (SR/2), e.g., -60
- freq: corner frequency (-3dB point) usually set to fundamental freq
- N: Number of filters in series where L = L/N

Reference https://ccrma.stanford.edu/realsimple/faust\_strings/Dynamic\_ Level Lowpass Filter.html

#### Mth-Octave Filter-Banks

Mth-octave filter-banks split the input signal into a bank of parallel signals, one for each spectral band. They are related to the Mth-Octave Spectrum-Analyzers in analysis.lib. The documentation of this library contains more details about the implementation. The parameters are:

- M: number of band-slices per octave (>1)
- N: total number of bands (>2)
- ftop: upper bandlimit of the Mth-octave bands (<SR/2)

In addition to the Mth-octave output signals, there is a highpass signal containing frequencies from ftop to SR/2, and a "dc band" lowpass signal containing frequencies from 0 (dc) up to the start of the Mth-octave bands. Thus, the N output signals are

```
highpass(ftop), MthOctaveBands(M,N-2,ftop), dcBand(ftop*2^(-M*(N-1)))
```

A Filter-Bank is defined here as a signal bandsplitter having the property that summing its output signals gives an allpass-filtered version of the filter-bank input signal. A more conventional term for this is an "allpass-complementary filter bank". If the allpass filter is a pure delay (and possible scaling), the filter

bank is said to be a "perfect-reconstruction filter bank" (see Vaidyanathan-1993 cited below for details). A "graphic equalizer", in which band signals are scaled by gains and summed, should be based on a filter bank.

The filter-banks below are implemented as Butterworth or Elliptic spectrumanalyzers followed by delay equalizers that make them allpass-complementary.

**Increasing Channel Isolation** Go to higher filter orders - see Regalia et al. or Vaidyanathan (cited below) regarding the construction of more aggressive recursive filter-banks using elliptic or Chebyshev prototype filters.

#### References

- "Tree-structured complementary filter banks using all-pass sections", Regalia et al., IEEE Trans. Circuits & Systems, CAS-34:1470-1484, Dec. 1987

- Elementary filter theory: https://ccrma.stanford.edu/~jos/filters/

#### mth\_octave\_filterbank[n]

Allpass-complementary filter banks based on Butterworth band-splitting. For Butterworth band-splits, the needed delay equalizer is easily found.

#### Usage

```
_ : mth_octave_filterbank(0,M,ftop,N) : par(i,N,_); // Oth-order
_ : mth_octave_filterbank_alt(0,M,ftop,N) : par(i,N,_); // dc-inverted version
Also for convenience:
_ : mth_octave_filterbank3(M,ftop,N) : par(i,N,_); // 3d-order Butterworth
_ : mth_octave_filterbank5(M,ftop,N) : par(i,N,_); // 5th-roder Butterworth
mth_octave_filterbank_default = mth_octave_analyzer6e;
```

- 0: order of filter used to split each frequency band into two
- M: number of band-slices per octave
- ftop: highest band-split crossover frequency (e.g., 20 kHz)
- N: total number of bands (including dc and Nyquist)

# Arbritary-Crossover Filter-Banks and Spectrum Analyzers

These are similar to the Mth-octave analyzers above, except that the band-split frequencies are passed explicitly as arguments.

#### filterbank

Filter bank. filterbank is a standard Faust function.

#### Usage

```
_ : filterbank (0,freqs) : par(i,N,_); // Butterworth band-splits Where:
```

- 0: band-split filter order (ODD integer required for filterbank[i])
- freqs: (fc1,fc2,...,fcNs) [in numerically ascending order], where Ns=N-1 is the number of octave band-splits (total number of bands N=Ns+1).

If frequencies are listed explicitly as arguments, enclose them in parens:

```
_ : filterbank(3,(fc1,fc2)) : _,_,_
```

#### filterbanki

Inverted-dc filter bank.

# Usage

```
_ : filterbanki(0,freqs) : par(i,N,_); // Inverted-dc version
```

#### Where:

- 0: band-split filter order (ODD integer required for filterbank[i])
- freqs: (fc1,fc2,...,fcNs) [in numerically ascending order], where Ns=N-1 is the number of octave band-splits (total number of bands N=Ns+1).

If frequencies are listed explicitly as arguments, enclose them in parens:

```
_ : filterbanki(3,(fc1,fc2)) : _,_,_
```

# hoa.lib

Faust library for high order ambisonic. Its official prefix is ho.

#### encoder

Ambisonic encoder. Encodes a signal in the circular harmonics domain depending on an order of decomposition and an angle.

### Usage

```
encoder(n, x, a) : _
```

Where:

- n: the order
- x: the signal
- a: the angle

#### decoder

Decodes an ambisonics sound field for a circular array of loudspeakers.

# Usage

```
_ : decoder(n, p) : _
```

Where:

- n: the order
- p: the number of speakers

**Note** Number of loudspeakers must be greater or equal to 2n+1. It's preferable to use 2n+2 loudspeakers.

#### decoderStereo

Decodes an ambisonic sound field for stereophonic configuration. An "home made" ambisonic decoder for stereophonic restitution ( $30^{\circ}$  -  $330^{\circ}$ ): Sound field lose energy around 180°. You should use inPhase optimization with ponctual sources. #### Usage

_ : decoderStereo(n) :	-
Where:	
• n: the order	

# **Optimization Functions**

Functions to weight the circular harmonics signals depending to the ambisonics optimization. It can be basic for no optimization, maxRe or inPhase.

#### optimBasic

The basic optimization has no effect and should be used for a perfect circle of loudspeakers with one listener at the perfect center loudspeakers array.

# Usage

```
_ : optimBasic(n) : _
Where:

• n: the order
```

### optimMaxRe

The maxRe optimization optimize energy vector. It should be used for an auditory confined in the center of the loudspeakers array.

```
_ : optimMaxRe(n) : _
```

#### Where:

• n: the order

# optimInPhase

The inPhase Optimization optimize energy vector and put all loudspeakers signals n phase. It should be used for an auditory.

### Usage

```
: optimInPhase(n) : _
here:
n: the order
```

#### wider

Can be used to wide the diffusion of a localized sound. The order depending signals are weighted and appear in a logarithmic way to have linear changes.

# Usage

```
_ : wider(n,w) : _
```

- n: the order
- w: the width value between 0 1

### map

It simulate the distance of the source by applying a gain on the signal and a wider processing on the soundfield.

## Usage

```
map(n, x, r, a)
```

#### Where:

- n: the order
- x: the signal
- r: the radius
- a: the angle in radian

#### rotate

Rotates the sound field.

# Usage

```
_ : rotate(n, a) : _
```

#### Where:

- n: the order
- a: the angle in radian

# maths.lib

Mathematic library for Faust. Some functions are implemented as Faust foreign functions of math.h functions that are not part of Faust's primitives. Defines also various constants and several utilities.

The official prefix of this library is ma.

# **Functions Reference**

SR

Current sampling rate (between 1Hz and 192000Hz). Constant during program execution.
Usage
SR : _
BS
Current block-size. Can change during the execution.
Usage
BS : _
PI
Constant PI in double precisio.n
Usage
PI : _

FTZ

Flush to zero: force samples under the "maximum subnormal number" to be zero. Usually not needed in C++ because the architecture file take care of this, but can be useful in javascript for instance.

Usage		
_ : ftz : _		
See: http://do	ocs.oracle.com/cd/E19957-01/806-3568/ncg_n	nath.html
neg		
Invert the sign	(-x) of a signal.	
Usage		
_ : neg : _		
sub(x,y)		
Subtract $\mathbf{x}$ and	y.	
inv		
Compute the in	nverse $(1/x)$ of the input signal.	
$\mathbf{U}\mathbf{sage}$		
_ : inv : _		
chrt		

Computes the cube root of the input signal.

Usage
_ : cbrt : _
hypot
Computes the euclidian distance of the two input signals $\operatorname{sqrt}(\mathbf{x}x+y\mathbf{y})$ without undue overflow or underflow.
Usage
_,_ : hypot : _
ldexp
Takes two input signals: x and n, and multiplies x by 2 to the power n.
Usage
_,_ : ldexp : _
scalb
Takes two input signals: x and n, and multiplies x by 2 to the power n.
Usage
_,_ : scalb : _

# log1p

Computes  $\log(1+x)$  without undue loss of accuracy when x is nearly zero.

Usage
_ : log1p : _
logb
Return exponent of the input signal as a floating-point number.
Usage
_ : logb : _
ilogb
Return exponent of the input signal as an integer number.
Usage
_ : ilogb : _
log2
Returns the base 2 logarithm of x.
Usage
_ : log2 : _

expm1

Return exponent of the input signal minus 1 with better precision.

Usage
_ : expm1 : _
acosh
Computes the principle value of the inverse hyperbolic cosine of the input signal.
Usage
_ : acosh : _
asinh
Computes the inverse hyperbolic sine of the input signal.
Usage
_ : asinh : _
atanh
Computes the inverse hyperbolic tangent of the input signal.
Usage
_ : atanh : _
sinh

Computes the hyperbolic sine of the input signal.

Usage
_ : sinh : _
cosh
Computes the hyperbolic cosine of the input signal.
Usage
_ : cosh : _
tanh
Computes the hyperbolic tangent of the input signal.
Usage
_ : tanh : _
erf
Computes the error function of the input signal.
Usage
_ : erf : _
erfc

Computes the complementary error function of the input signal.

Usage
_ : erfc : _
gamma
Computes the gamma function of the input signal.
Usage
_ : gamma : _
lgamma
Calculates the natural logorithm of the absolute value of the gamma function of the input signal.
Usage
_ : lgamma : _
JO
Computes the Bessel function of the first kind of order 0 of the input signal.
Usage
_ : JO : _
J1

Computes the Bessel function of the first kind of order 1 of the input signal.

Usage
_ : J1 : _
Jn
Computes the Bessel function of the first kind of order n (first input signal) of the second input signal.
Usage
_,_ : Jn : _
чо
Computes the linearly independent Bessel function of the second kind of order 0 of the input signal.
Usage
_ : YO : _
Y1
Computes the linearly independent Bessel function of the second kind of order 1 of the input signal.
Usage
_ : YO : _

# Yn

Computes the linearly independent Bessel function of the second kind of order n (first input signal) of the second input signal.

# Usage \_,\_ : Yn : \_ fabs, fmax, fmin Just for compatibility... fabs = abs fmax = maxfmin = minnp2Gives the next power of 2 of x. Usage np2(n) : \_ Where: • n: an integer

# ${\tt frac}$

Gives the fractional part of n.

# Usage frac(n): \_ Where: • n: a decimal number

# isnan

Return non-zero if and only if x is a NaN.

# Usage

```
isnan(x)
_ : isnan : _
```

Where:

• x: signal to analyse

# chebychev

Chebychev transformation of order n.

# Usage

```
_ : chebychev(n) : _
```

Where:

• n: the order of the polynomial

# Semantics

```
T[0](x) = 1,

T[1](x) = x,

T[n](x) = 2x*T[n-1](x) - T[n-2](x)
```

Reference http://en.wikipedia.org/wiki/Chebyshev_polynomial
chebychevpoly
Linear combination of the first Chebyshev polynomials.
Usage
_ : chebychevpoly((c0,c1,,cn)) : _
Where:
• cn: the different Chebychevs polynomials such that: cheby chevpoly((c0,c1,,cn)) = Sum of chebychev(i)*ci
Reference http://www.csounds.com/manual/html/chebyshevpoly.html
diffn Negated first-order difference.
Usage
_ : diffn : _
signum
The signum function signum(x) is defined as -1 for $x<0$ , 0 for $x==0$ , and 1 for $x>0$ ;
Usage
_ : signum : _

# misceffects.lib

This library contains a collection of audio effects. Its official prefix is ef.

# **Dynamic**

#### cubicnl

Cubic nonlinearity distortion. cubicnl is a standard Faust library.

#### Usage:

```
_ : cubicnl(drive,offset) : _
_ : cubicnl_nodc(drive,offset) : _
```

#### Where:

- drive: distortion amount, between 0 and 1
- offset: constant added before nonlinearity to give even harmonics. Note: offset can introduce a nonzero mean feed cubicnl output to dcblocker to remove this.

#### References:

- $https://ccrma.stanford.edu/\sim jos/pasp/Cubic\_Soft\_Clipper.html$
- $https://ccrma.stanford.edu/\sim jos/pasp/Nonlinear\_Distortion.html$

# ${\tt gate\_mono}$

Mono signal gate. gate\_mono is a standard Faust function.

# Usage

```
_ : gate_mono(thresh,att,hold,rel) : _
```

#### Where:

• thresh: dB level threshold above which gate opens (e.g., -60 dB)

- att: attack time = time constant (sec) for gate to open (e.g., 0.0001 s = 0.1 ms)
- hold: hold time = time (sec) gate stays open after signal level < thresh (e.g., 0.1 s)
- rel: release time = time constant (sec) for gate to close (e.g., 0.020 s = 20 ms)

#### References

- http://en.wikipedia.org/wiki/Noise\_gate
- http://www.soundonsound.com/sos/apr01/articles/advanced.asp
- http://en.wikipedia.org/wiki/Gating\_(sound\_engineering)

# gate\_stereo

Stereo signal gates. gate\_stereo is a standard Faust function.

#### Usage

```
_,_ : gate_stereo(thresh,att,hold,rel) : _,_
```

# Where:

- thresh: dB level threshold above which gate opens (e.g., -60 dB)
- att: attack time = time constant (sec) for gate to open (e.g., 0.0001 s = 0.1 ms)
- hold: hold time = time (sec) gate stays open after signal level < thresh (e.g., 0.1 s)
- rel: release time = time constant (sec) for gate to close (e.g., 0.020 s = 20 ms)

#### References

- $\bullet \ \ http://en.wikipedia.org/wiki/Noise\_gate$
- http://www.soundonsound.com/sos/apr01/articles/advanced.asp
- http://en.wikipedia.org/wiki/Gating\_(sound\_engineering)

# **Filtering**

#### speakerbp

Dirt-simple speaker simulator (overall bandpass eq with observed roll-offs above and below the passband).

Low-frequency speaker model = +12 dB/octave slope breaking to flat near f1. Implemented using two dc blockers in series.

High-frequency model = -24 dB/octave slope implemented using a fourth-order Butterworth lowpass.

Example based on measured Celestion G12 (12" speaker):

speakerbp is a standard Faust function

#### Usage

```
speakerbp(f1,f2)
_ : speakerbp(130,5000) : _
```

# piano\_dispersion\_filter

Piano dispersion allpass filter in closed form.

# Usage

```
piano_dispersion_filter(M,B,f0)
_ : piano_dispersion_filter(1,B,f0) : +(totalDelay),_ : fdelay(maxDelay) : _
```

#### Where:

- M: number of first-order allpass sections (compile-time only) Keep below 20. 8 is typical for medium-sized piano strings.
- B: string inharmonicity coefficient (0.0001 is typical)
- $\bullet\,$  f0: fundamental frequency in Hz

# Outputs

- MINUS the estimated delay at f0 of all pass chain in samples, provided in negative form to facilitate subtraction from delay-line length.
- Output signal from allpass chain

# stereo\_width

Stereo Width effect using the Blumlein Shuffler technique. stereo\_width is a standard Faust function.

# Usage

```
_,_ : stereo_width(w) : _,_
```

#### Where:

• w: stereo width between 0 and 1

At w=0, the output signal is mono ((left+right)/2 in both channels). At w=1, there is no effect (original stereo image). Thus, w between 0 and 1 varies stereo width from 0 to "original".

#### Reference

• "Applications of Blumlein Shuffling to Stereo Microphone Techniques" Michael A. Gerzon, JAES vol. 42, no. 6, June 1994

# Time Based

#### echo

A simple echo effect.

echo is a standard Faust function

# Usage

```
_ : echo(maxDuration,duration,feedback) : _
```

#### Where:

- maxDuration: the max echo duration in seconds
- duration: the echo duration in seconds
- feedback: the feedback coefficient

# Pitch Shifting

# transpose

A simple pitch shifter based on 2 delay lines. transpose is a standard Faust function.

# Usage

```
_ : transpose(w, x, s) : _
```

# Where:

- $\bullet$  w: the window length (samples)
- x: crossfade duration duration (samples)
- s: shift (semitones)

# Meshes

# mesh\_square

Square Rectangular Digital Waveguide Mesh.

# Usage

```
bus(4*N) : mesh_square(N) : bus(4*N);
```

# Where:

• N: number of nodes along each edge - a power of two (1,2,4,8,...)

 $\begin{tabular}{ll} \bf Reference & https://ccrma.stanford.edu/^jos/pasp/Digital\_Waveguide\_\\ Mesh.html & \\ \end{tabular}$ 

Signal Order In and Out The mesh is constructed recursively using 2x2 embeddings. Thus, the top level of mesh\_square(M) is a block 2x2 mesh, where each block is a mesh(M/2). Let these blocks be numbered 1,2,3,4 in the geometry NW,NE,SW,SE, i.e., as 1 2 3 4 Each block has four vector inputs and four vector outputs, where the length of each vector is M/2. Label the input vectors as Ni,Ei,Wi,Si, i.e., as the inputs from the North, East South, and West, and similarly for the outputs. Then, for example, the upper left input block of M/2 signals is labeled 1Ni. Most of the connections are internal, such as 1Eo -> 2Wi. The 8\*(M/2) input signals are grouped in the order 1Ni 2Ni 3Si 4Si 1Wi 3Wi 2Ei 4Ei and the output signals are 1No 1Wo 2No 2Eo 3So 3Wo 4So 4Eo or

In: 1No 1Wo 2No 2Eo 3So 3Wo 4So 4Eo

Out: 1Ni 2Ni 3Si 4Si 1Wi 3Wi 2Ei 4Ei

Thus, the inputs are grouped by direction N,S,W,E, while the outputs are grouped by block number 1,2,3,4, which can also be interpreted as directions NW, NE, SW, SE. A simple program illustrating these orderings is process = mesh\_square(2);.

**Example** Reflectively terminated mesh impulsed at one corner:

```
mesh_square_test(N,x) = mesh_square(N)~(busi(4*N,x)) // input to corner with { busi(N,x) = bus(N) : par(i,N,*(-1)) : par(i,N-1,_), +(x); }; process = 1-1' : mesh_square_test(4); // all modes excited forever
```

In this simple example, the mesh edges are connected as follows:

```
1No -> 1Ni, 1Wo -> 2Ni, 2No -> 3Si, 2Eo -> 4Si, 3So -> 1Wi, 3Wo -> 3Wi, 4So -> 2Ei, 4Eo -> 4Ei
```

A routing matrix can be used to obtain other connection geometries.

# noises.lib

Faust Noise Generator Library. Its official prefix is no.

#### Functions Reference

#### noise

White noise generator (outputs random number between -1 and 1). Noise is a standard Faust function.

Usage
noise : _
multirandom
Generates multiple decorrelated random numbers in parallel.
Usage
<pre>multirandom(n) : si.bus(n)</pre>
Where:
$\bullet$ n: the number of decorrelated random numbers in parallel
multinoise
Generates multiple decorrelated noises in parallel.
Usage
multinoise(n) : si.bus(n)
Where:
$\bullet$ n: the number of decorrelated random numbers in parallel
noises
TODO.

# pink\_noise

Pink noise (1/f noise) generator (third-order approximation) pink\_noise is a standard Faust function.

# Usage

```
pink_noise : _;
```

**Reference:** https://ccrma.stanford.edu/~jos/sasp/Example\_Synthesis\_1\_ F\_Noise.html

# pink\_noise\_vm

Multi pink noise generator.

# Usage

```
pink_noise_vm(N) : _;
```

# Where:

• N: number of latched white-noise processes to sum, not to exceed size of (int) in C++ (typically 32).

# References

- http://www.dsprelated.com/showarticle/908.php
- http://www.firstpr.com.au/dsp/pink-noise/#Voss-McCartney

# lfnoise, lfnoise0 and lfnoiseN $\,$

Low-frequency noise generators (Butterworth-filtered downsampled white noise)

# Usage

• f0: average frequency of noise impulses per second

Random impulses in the amplitude range -1 to 1 are generated at an average rate of f0 impulses per second.

#### Reference

• See velvet\_noise

velvet\_noise\_vm

velvet noise generator.

# Usage

```
velvet_noise(amp,f0) : _;
```

#### Where:

- amp: amplitude of noise impulses (positive and negative)
- f0: average frequency of noise impulses per second

#### Reference

• Matti Karjalainen and Hanna Jarvelainen, "Reverberation Modeling Using Velvet Noise", in Proc. 30th Int. Conf. Intelligent Audio Environments (AES07), March 2007.

#### gnoise

approximate zero-mean, unit-variance Gaussian white noise generator

#### Usage

```
gnoise(N) : _;
```

# Where:

 $\bullet\,$  N: number of uniform random numbers added to approximate Gaussian white noise

# Reference

• See Central Limit Theorem

# oscillators.lib

This library contains a collection of sound generators. Its official prefix is os.

# Wave-Table-Based Oscillators

sinwaveform
PIUMAVGIOIM
Sine waveform ready to use with a rdtable.
Usage
sinwaveform(tablesize) : _
Where:
• tablesize: the table size
coswaveform
Cosine waveform ready to use with a rdtable.
Usage
coswaveform(tablesize) : _
Where:
• tablesize: the table size
phasor
A simple phasor to be used with a rdtable. phasor is a standard Faust function.
Usage
phasor(tablesize,freq) : _
Where:
• tablesize: the table size

 $\bullet\,$  freq: the frequency of the wave (Hz)

# oscsin Sine wave oscillator. oscsin is a standard Faust function. Usage oscsin(freq) : \_ Where: $\bullet\,$ freq: the frequency of the wave (Hz) osccos Cosine wave oscillator. Usage osccos(freq) : \_ Where: • freq: the frequency of the wave (Hz) oscp A sine wave generator with controllable phase. Usage oscp(freq,p) : \_ Where:

 $\bullet\,$  freq: the frequency of the wave (Hz)

• p: the phase in radian

# osci

Interpolated phase sine wave oscillator.

# Usage

```
osci(freq) : _
```

Where:

• freq: the frequency of the wave (Hz)

# **LFOs**

Low-frequency oscillators have prefix <code>lf\_</code> (no aliasing suppression, signal-means not necessarily zero).

# lf\_imptrain

Unit-amplitude low-frequency impulse train. lf\_imptrain is a standard Faust function.

# Usage

```
lf_imptrain(freq) : _
```

Where:

 $\bullet\,$  freq: frequency in Hz

# lf\_pulsetrainpos

Unit-amplitude nonnegative LF pulse train, duty cycle between 0 and 1

${f Usage}$
<pre>lf_pulsetrainpos(freq,duty) : _</pre>
Where:
<ul> <li>freq: frequency in Hz</li> <li>duty: duty cycle between 0 and 1</li> </ul>
lf_squarewavepos
Positive LF square wave in [0,1]
$\mathbf{U}_{\mathbf{S}\mathbf{a}\mathbf{g}\mathbf{e}}$
lf_squarewavepos(freq) : _
Where:
• freq: frequency in Hz
lf_squarewave
Zero-mean unit-amplitude LF square wave. lf_squarewave is a standard Faust function.
$\mathbf{U}_{\mathbf{Sage}}$
lf_squarewave(freq) : _
Where:
• freq: frequency in Hz

# lf\_trianglepos

Positive unit-amplitude LF positive triangle wave

#### Usage

lf\_trianglepos(freq) : \_

Where:

• freq: frequency in Hz

# Low Frequency Sawtooths

Sawtooth waveform oscillators for virtual analog synthesis et al. The 'simple' versions (lf\_rawsaw, lf\_sawpos and saw1), are mere samplings of the ideal continuous-time ("analog") waveforms. While simple, the aliasing due to sampling is quite audible. The differentiated polynomial waveform family (saw2, sawN, and derived functions) do some extra processing to suppress aliasing (not audible for very low fundamental frequencies). According to Lehtonen et al. (JASA 2012), the aliasing of saw2 should be inaudible at fundamental frequencies below 2 kHz or so, for a 44.1 kHz sampling rate and 60 dB SPL presentation level; fundamentals 415 and below required no aliasing suppression (i.e., saw1 is ok).

#### lf\_rawsaw

Simple sawtooth waveform oscillator between 0 and period in samples.

# Usage

lf\_rawsaw(periodsamps)

Where:

 $\bullet\,$  periods amps: number of periods per samples

# lf\_sawpos\_phase

Simple sawtooth waveform oscillator between 0 and 1 with phase control.

#### Usage

lf\_sawpos\_phase(freq,phase)

Where:

freq: frequencyphase: phase

#### **Bandlimited Sawtooth**

//——sawN——Bandlimited Sawtooth
sawN(N,freq), sawNp, saw2dpw(freq), saw2(freq), saw3(freq), saw4(freq),
saw5(freq), saw6(freq), sawtooth(freq), saw2f2(freq) saw2f4(freq)

Method 1 (saw2) Polynomial Transition Regions (PTR) (for aliasing suppression)

#### Reference

- Kleimola, J.; Valimaki, V., "Reducing Aliasing from Synthetic Audio Signals Using Polynomial Transition Regions," in Signal Processing Letters, IEEE, vol.19, no.2, pp.67-70, Feb. 2012
- http://research.spa.aalto.fi/publications/papers/spl-ptr/

Method 2 (sawN) Differentiated Polynomial Waves (DPW) (for aliasing suppression)

**Reference** "Alias-Suppressed Oscillators based on Differentiated Polynomial Waveforms", Vesa Valimaki, Juhan Nam, Julius Smith, and Jonathan Abel, IEEE Tr. Acoustics, Speech, and Language Processing (IEEE-ASLP), Vol. 18, no. 5, May 2010.

Other Cases Correction-filtered versions of saw2: saw2f2, saw2f4 The correction filter compensates "droop" near half the sampling rate. See reference for sawN.

# Usage

```
sawN(N,freq) : _
sawNp(N,freq,phase) : _
saw2dpw(freq) : _
saw2(freq) : _
saw3(freq) : _ // based on sawN
saw4(freq) : _ // based on sawN
saw5(freq) : _ // based on sawN
saw6(freq) : _ // based on sawN
sawtooth(freq) : _ // = saw2
saw2f2(freq) : _
saw2f4(freq) : _
```

# Where:

- N: polynomial order
- freq: frequency in Hz
- phase: phase

# sawNp

TODO: MarkDown doc in comments

# saw2dpw

TODO: MarkDown doc in comments

#### saw3

TODO: MarkDown doc in comments

#### sawtooth

Alias-free sawtooth wave. 2nd order interpolation (based on saw2). sawtooth is a standard Faust function.

Usage
sawtooth(freq) : _
Where:
• freq: frequency
saw2f2
TODO: MarkDown doc in comments
saw2f4
TODO: MarkDown doc in comments

# Bandlimited Pulse, Square, and Impulse Trains

Bandlimited Pulse, Square, and Impulse Trains

 $\verb"pulsetrain", \verb"pulsetrain", \verb"square", \verb"imptrain", imptrain", triangle, triangle"$ 

All are zero-mean and meant to oscillate in the audio frequency range. Use simpler sample-rounded  $lf_*$  versions above for LFOs.

# Usage

```
pulsetrainN(N,freq,duty) : _
pulsetrain(freq, duty) : _ // = pulsetrainN(2)
squareN(N, freq) : _
square : _ // = squareN(2)
imptrainN(N,freq) : _
imptrain : _ // = imptrainN(2)
triangleN(N,freq) : _
triangle : _ // = triangleN(2)
```

# Where:

- N: polynomial order
- freq: frequency in Hz

# pulsetrainN

TODO: MarkDown doc in comments

# pulsetrain

Bandlimited pulse train oscillator. Based on pulsetrainN(2). pulsetrain is a standard Faust function.

# Usage

```
pulsetrain(freq, duty) : _
```

#### Where:

- freq: frequency
- duty: duty cycle between 0 and 1

# squareN

TODO: MarkDown doc in comments

\_\_\_\_\_

Bandlimited square wave oscillator. Based on squareN(2). square is a standard Faust function.
Usage
<pre>square(freq) : _</pre>
Where:
• freq: frequency
impulac
impulse
One-time impulse generated when the Faust process is started. impulse is a standard Faust function.
Usage
<pre>impulse : _</pre>
imptrainN
TODO: MarkDown doc in comments

# imptrain

square

Bandlimited impulse train generator. Based on  ${\tt imptrainN(2)}$ . imptrain is a standard Faust function.

Usage
<pre>imptrain(freq) : _</pre>
Where:
• freq: frequency
triangleN
TODO: MarkDown doc in comments
triangle
Bandlimited triangle wave oscillator. Based on triangleN(2). triangle is a standard Faust function.
Usage
<pre>triangle(freq) : _</pre>
Where:
• freq: frequency
Filter-Based Oscillators
Filter-Based Oscillators
Usage
osc[b r rs rc s w](f), where f = frequency in Hz.

# References

#### oscb

Sinusoidal oscillator based on the biquad.

# Usage

```
oscb(freq) : _
```

Where:

• freq: frequency

#### oscrq

Sinusoidal (sine and cosine) oscillator based on 2D vector rotation, = undamped "coupled-form" resonator = lossless 2nd-order normalized ladder filter.

# Usage

```
oscrq(freq) : _,_
```

Where:

• freq: frequency

# Reference

• https://ccrma.stanford.edu/~jos/pasp/Normalized\_Scattering\_ Junctions.html

#### oscrs

Sinusoidal (sine) oscillator based on 2D vector rotation, = undamped "coupled-form" resonator = lossless 2nd-order normalized ladder filter.

# Usage

```
oscrs(freq) : _
```

#### Where:

• freq: frequency

#### Reference

#### oscrc

Sinusoidal (cosine) oscillator based on 2D vector rotation, = undamped "coupled-form" resonator = lossless 2nd-order normalized ladder filter.

# Usage

```
oscrc(freq) : _
```

# Where:

• freq: frequency

#### Reference

 • https://ccrma.stanford.edu/~jos/pasp/Normalized\_Scattering\_ Junctions.html osc

Default sine wave oscillator (same as oscrs). osc is a standard Faust function.

# Usage

osc(freq) : \_

Where:

 $\bullet\,$  freq: the frequency of the wave (Hz)

oscs

Sinusoidal oscillator based on the state variable filter = undamped "modified-coupled-form" resonator = "magic circle" algorithm used in graphics

# Waveguide-Resonator-Based Osccilators

Sinusoidal oscillator based on the waveguide resonator wgr.

oscw

Sinusoidal oscillator based on the waveguide resonator wgr. Unit-amplitude cosine oscillator.

# Usage

oscwc(freq) : \_

Where:

• freq: frequency

<b>T</b>	•	
Ref	Oro	nco
TOCI	CI C	$\mathbf{n}$

• https://ccrma.stanford.edu/~jos/pasp/Digital_Waveguide_Oscillator. html
oscws
Sinusoidal oscillator based on the waveguide resonator ${\tt wgr.}$ Unit-amplitude sine oscillator
Usage
oscws(freq) : _
Where:
• freq: frequency
Reference
oscwq
Sinusoidal oscillator based on the waveguide resonator ${\tt wgr.}$ Unit-amplitude cosine and sine (quadrature) oscillator.
Usage
oscwq(freq) : _
Where:
• freq: frequency

• https://ccrma.stanford.edu/~jos/pasp/Digital_Waveguide_Oscillator. html
oscw
Sinusoidal oscillator based on the waveguide resonator ${\tt wgr.}$ Unit-amplitude cosine oscillator (default)
Usage
oscw(freq) : _
Where:
• freq: frequency
Reference
• https://ccrma.stanford.edu/~jos/pasp/Digital_Waveguide_Oscillator. html
lf_sawpos
Simple sawtooth waveform oscillator between 0 and 1.
Usage
<pre>lf_sawpos(freq)</pre>
Where:
• freq: frequency

# 

# phaflangers.lib

A library of phasor and flanger effects. Its official prefix is  ${\tt pf}$ .

# **Functions Reference**

flanger\_mono

Mono flanging effect.

# Usage: \_ : flanger\_mono(dmax,curdel,depth,fb,invert) : \_; Where: • dmax: maximum delay-line length (power of 2) - 10 ms typical • curdel: current dynamic delay (not to exceed dmax) • depth: effect strength between 0 and 1 (1 typical) • fb: feedback gain between 0 and 1 (0 typical) • invert: 0 for normal, 1 to invert sign of flanging sum Reference https://ccrma.stanford.edu/~jos/pasp/Flanging.html flanger\_stereo Stereo flanging effect. flanger\_stereo is a standard Faust function. Usage: \_,\_ : flanger\_stereo(dmax,curdel1,curdel2,depth,fb,invert) : \_,\_; Where: • dmax: maximum delay-line length (power of 2) - 10 ms typical • curdel: current dynamic delay (not to exceed dmax) • depth: effect strength between 0 and 1 (1 typical) • **fb**: feedback gain between 0 and 1 (0 typical) • invert: 0 for normal, 1 to invert sign of flanging sum Reference https://ccrma.stanford.edu/~jos/pasp/Flanging.html phaser2\_mono

Mono phasing effect.

#### Phaser

\_ : phaser2\_mono(Notches,phase,width,frqmin,fratio,frqmax,speed,depth,fb,invert) : \_;

#### Where:

- Notches: number of spectral notches (MACRO ARGUMENT not a signal)
- phase: phase of the oscillator (0-1)
- width: approximate width of spectral notches in Hz
- frqmin: approximate minimum frequency of first spectral notch in Hz
- fratio: ratio of adjacent notch frequencies
- frqmax: approximate maximum frequency of first spectral notch in Hz
- speed: LFO frequency in Hz (rate of periodic notch sweep cycles)
- depth: effect strength between 0 and 1 (1 typical) (aka "intensity") when depth=2, "vibrato mode" is obtained (pure allpass chain)
- fb: feedback gain between -1 and 1 (0 typical)
- invert: 0 for normal, 1 to invert sign of flanging sum

#### Reference:

phaser2\_stereo

Stereo phasing effect. phaser2\_stereo is a standard Faust function.

#### Phaser

\_ : phaser2\_stereo(Notches,phase,width,frqmin,fratio,frqmax,speed,depth,fb,invert) : \_;

#### Where:

• Notches: number of spectral notches (MACRO ARGUMENT - not a signal)

- phase: phase of the oscillator (0-1)
- width: approximate width of spectral notches in Hz
- frqmin: approximate minimum frequency of first spectral notch in Hz
- fratio: ratio of adjacent notch frequencies
- frgmax: approximate maximum frequency of first spectral notch in Hz
- speed: LFO frequency in Hz (rate of periodic notch sweep cycles)
- depth: effect strength between 0 and 1 (1 typical) (aka "intensity") when depth=2, "vibrato mode" is obtained (pure allpass chain)
- fb: feedback gain between -1 and 1 (0 typical)
- invert: 0 for normal, 1 to invert sign of flanging sum

# physmodels.lib

 $B = _{,_{,_{,_{,_{i}}}}};$ 

};

Faust physical modeling library. Its official prefix is pm.

```
chain(A:B:...)
```

Creates a chain of bidirectional blocks. Blocks must have 3 inputs and outputs. The first input/output correspond to the left going signal, the second input/output correspond to the right going signal and the third input/output is the mix of the main signal output. The implied one sample delay created by the ~ operator is generalized to the left and right going waves. Thus, n blocks in chain() will add an n samples delay to both the left and right going waves. ### Usage

```
rightGoingWaves,leftGoingWaves,mixedOutput : chain(A:B) : rightGoingWaves,leftGoingWaves,mix
with{
    A = _,_,_;
```

# Requires

routes.lib (crossnn)

# input(x)

Adds a waveguide input anywhere between 2 blocks in a chain of blocks (see chain()). ### Usage

```
string(x) = chain(A:input(x):B)
```

Where x is the input signal to be added to the chain.

\_\_\_\_\_

# output()

};

Adds a waveguide output anywhere between 2 blocks in a chain of blocks and sends it to the mix output channel (see chain()). ### Usage

# terminations(a,b,c)

chain(A:output:B)

Creates terminations on both sides of a chain() without closing the inputs and outputs of the bidirectional signals chain. As for chain(), this function adds a 1 sample delay to the bidirectional signal both ways. ### Usage

```
rightGoingWaves,leftGoingWaves,mixedOutput : terminations(a,b,c) : rightGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWav
```

```
Requires
```

```
routes.lib (crossnn)
```

# fullTerminations(a,b,c)

Same as terminations() but closes the inputs and outputs of the bidirectional chain (only the mixed output remains). ### Usage

```
terminations(a,b,c) : _
with{
    a = *(-1); // left termination
    b = chain(D:E:F); // bidirectional chain of blocks (D, E, F, etc.)
    c = *(-1); // right termination
};
```

#### Requires

```
routes.lib (crossnn)
```

# leftTermination(a,b)

Creates a termination on the left side of a chain() without closing the inputs and outputs of the bidirectional signals chain. This function adds a 1 sample delay near the termination. ### Usage

```
rightGoingWaves,leftGoingWaves,mixedOutput : terminations(a,b) : rightGoingWaves,leftGoingWaves
with{
    a = *(-1); // left termination
    b = chain(D:E:F); // bidirectional chain of blocks (D, E, F, etc.)
```

# Requires

};

```
routes.lib (crossnn)
```

# rightTermination(b,c)

Creates a termination on the right side of a chain() without closing the inputs and outputs of the bidirectional signals chain. This function adds a 1 sample delay near the termination. ### Usage

```
rightGoingWaves,leftGoingWaves,mixedOutput : terminations(b,c) : rightGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingWaves,leftGoingW
```

rightGoingWaves,leftGoingWaves,mixedOutput : waveguide(nMax,n) : rightGoingWaves,leftGoingwaves,leftGoingwaves,leftGoingwaves,leftGoingwaves,leftGoingwaves,leftGoingwaves,leftGoingwaves,leftGoingwaves,leftGoingwaves,leftGoingwaves,

# Requires

```
routes.lib (crossnn)
```

# waveguide(nMax,n)

A simple waveguide block based on a 4th order fractional delay. ### Usage

```
With * nMay the maximum length of the waveguide in samples * n the length
```

With: \* nMax: the maximum length of the waveguide in samples \* n the length of the waveguide in samples. ### Requires delays.lib (fdelay4)

# idealString(length,reflexion,xPosition,x)

An ideal string with rigid terminations and where the plucking position and the pick-up position are the same. ### Usage

```
1-1': idealString(length,reflexion,xPosition,x)
```

With: \* length: the length of the string in meters \* reflexion: the coefficient of reflexion (0-0.9999999) \* pluckPosition: the plucking position (0.001-0.999) \* x: the input signal for the excitation ### Requires routes.lib (crossnn) delays.lib (fdelay4)

# reverbs.lib

A library of reverb effects. Its official prefix is re.

# Schroeder Reverberators

#### jcrev

This artificial reverberator take a mono signal and output stereo (satrev) and quad (jcrev). They were implemented by John Chowning in the MUS10 computer-music language (descended from Music V by Max Mathews). They are Schroeder Reverberators, well tuned for their size. Nowadays, the more expensive freeverb is more commonly used (see the Faust examples directory).

jcrev reverb below was made from a listing of "RV", dated April 14, 1972, which was recovered from an old SAIL DART backup tape. John Chowning thinks this might be the one that became the well known and often copied JCREV.

jcrev is a standard Faust function

#### Usage

\_ : jcrev : \_,\_,\_,

#### satrev

This artificial reverberator take a mono signal and output stereo (satrev) and quad (jcrev). They were implemented by John Chowning in the MUS10 computer-music language (descended from Music V by Max Mathews). They are Schroeder Reverberators, well tuned for their size. Nowadays, the more expensive freeverb is more commonly used (see the Faust examples directory).

satrev was made from a listing of "SATREV", dated May 15, 1971, which was recovered from an old SAIL DART backup tape. John Chowning thinks this might be the one used on his often-heard brass canon sound examples, one of which can be found at <a href="https://ccrma.stanford.edu/~jos/wav/FM\_BrassCanon2.wav">https://ccrma.stanford.edu/~jos/wav/FM\_BrassCanon2.wav</a>

#### Usage

\_ : satrev : \_,\_

# Feedback Delay Network (FDN) Reverberators

#### fdnrev0

Pure Feedback Delay Network Reverberator (generalized for easy scaling). fdnrev0 is a standard Faust function.

#### Usage

```
<1,2,4,...,N signals> <:
fdnrev0(MAXDELAY,delays,BBSO,freqs,durs,loopgainmax,nonl) :>
<1,2,4,...,N signals>
```

#### Where:

- N: 2, 4, 8, ... (power of 2)
- MAXDELAY: power of 2 at least as large as longest delay-line length
- delays: N delay lines, N a power of 2, lengths perferably coprime
- BBSO: odd positive integer = order of bandsplit desired at freqs
- freqs: NB-1 crossover frequencies separating desired frequency bands
- durs: NB decay times (t60) desired for the various bands
- loopgainmax: scalar gain between 0 and 1 used to "squelch" the reverb
- nonl: nonlinearity (0 to 0.999..., 0 being linear)

 $\label{lem:reference} \textbf{Reference} \quad \text{https://ccrma.stanford.edu/$^{\circ}$jos/pasp/FDN\_Reverberation.} \\ \text{html}$ 

#### zita rev fdn

Internal 8x8 late-reverberation FDN used in the FOSS Linux reverb zita-rev1 by Fons Adriaensen fons@linuxaudio.org. This is an FDN reverb with allpass comb filters in each feedback delay in addition to the damping filters.

#### Usage

```
bus(8) : zita_rev_fdn(f1,f2,t60dc,t60m,fsmax) : bus(8)
```

## Where:

• f1: crossover frequency (Hz) separating dc and midrange frequencies

- f2: frequency (Hz) above f1 where T60 = t60 m/2 (see below)
- t60dc: desired decay time (t60) at frequency 0 (sec)
- t60m: desired decay time (t60) at midrange frequencies (sec)
- fsmax: maximum sampling rate to be used (Hz)

#### Reference

- http://www.kokkinizita.net/linuxaudio/zita-rev1-doc/quickguide.html
- $https://ccrma.stanford.edu/\sim jos/pasp/Zita\_Rev1.html$

# zita\_rev1\_stereo

Extend zita\_rev\_fdn to include zita\_rev1 input/output mapping in stereo mode. zita\_rev1\_stereo is a standard Faust function.

# Usage

```
_,_ : zita_rev1_stereo(rdel,f1,f2,t60dc,t60m,fsmax) : _,_
```

#### Where:

rdel = delay (in ms) before reverberation begins (e.g., 0 to ~100 ms) (remaining args and refs as for  $zita_rev_fdn$  above)

#### zita\_rev1\_ambi

Extend zita\_rev\_fdn to include zita\_rev1 input/output mapping in "ambisonics mode", as provided in the Linux C++ version.

# Usage

```
_,_ : zita_rev1_ambi(rgxyz,rdel,f1,f2,t60dc,t60m,fsmax) : _,_,_,
```

#### Where:

 $\label{eq:rgxyz} \mbox{ = relative gain of lanes 1,4,2 to lane 0 in output (e.g., -9 to 9) (remaining args and references as for zita\_rev1\_stereo above)}$ 

## Freeverb

## mono\_freeverb

A simple Schroeder reverberator primarily developed by "Jezar at Dreampoint" that is extensively used in the free-software world. It uses four Schroeder allpasses in series and eight parallel Schroeder-Moorer filtered-feedback comb-filters for each audio channel, and is said to be especially well tuned.

mono\_freeverb is a standard Faust function.

#### Usage

```
_ : mono_freeverb(fb1, fb2, damp, spread) : _;
```

#### Where:

- **fb1**: coefficient of the lowpass comb filters (0-1)
- fb2: coefficient of the allpass comb filters (0-1)
- damp: damping of the lowpass comb filter (0-1)
- spread: spatial spread in number of samples (for stereo)

**License** While this version is licensed LGPL (with exception) along with other GRAME library functions, the file freeverb.dsp in the examples directory of older Faust distributions, such as faust-0.9.85, was released under the BSD license, which is less restrictive.

# stereo\_freeverb

A simple Schroeder reverberator primarily developed by "Jezar at Dreampoint" that is extensively used in the free-software world. It uses four Schroeder allpasses in series and eight parallel Schroeder-Moorer filtered-feedback comb-filters for each audio channel, and is said to be especially well tuned.

#### Usage

```
_,_ : stereo_freeverb(fb1, fb2, damp, spread) : _,_;
```

- fb1: coefficient of the lowpass comb filters (0-1)
- fb2: coefficient of the allpass comb filters (0-1)
- damp: damping of the lowpass comb filter (0-1)
- spread: spatial spread in number of samples (for stereo)

# routes.lib

A library of basic elements to handle signal routing in Faust. Its official prefix is ro.

# **Functions Reference**

#### cross

Cross n signals:  $(x1,x2,...,xn) \rightarrow (xn,...,x2,x1)$ . cross is a standard Faust function.

# Usage

```
cross(n)
_,_, : cross(3) : _,_,_
```

Where:

• n: number of signals (int, must be known at compile time)

```
{\bf Note}\quad {\bf Special\ case:\ cross2:}
```

```
cross2 = _, cross(2),_;
```

## crossnn

Cross two bus(n)s.

# Usage \_,\_,... : crossmm(n) : \_,\_,... Where: • n: the number of signals in the bus crossn1 Cross bus(n) and bus(1). Usage \_,\_,... : crossn1(n) : \_,\_,... Where: • n: the number of signals in the first bus interleave Interleave row col cables from column order to row order. input: x(0), x(1), x(2)..., x(rowcol-1) output: x(0+0row), x(0+1row), x(0+2row), ..., x(1+0row), $x(1+1row), x(1+2row), \dots$ Usage \_,\_,\_,\_ : interleave(row,column) : \_,\_,\_,\_, Where: • row: the number of row (int, known at compile time) • column: the number of column (int, known at compile time)

# butterfly

Addition (first half) then substraction (second half) of interleaved signals.

# Usage

```
_,_,_ : butterfly(n) : _,_,_,
```

Where:

 $\bullet\,$  n: size of the butterfly (n is int, even and known at compile time)

#### hadamard

Hadamard matrix function of size  $n = 2^k$ .

# Usage

```
_,_,_ : hadamard(n) : _,_,_
```

Where:

• n: 2^k, size of the matrix (int, must be known at compile time)

Note: Implementation contributed by Remy Muller.

Create a recursion from two arbitrary processors p and q.

# Usage

recursivize

```
_,_ : recursivize(p,q) : _,_
```

- $\bullet\,$  p: the forward arbitrary processor
- q: the feedback arbitrary processor

# signals.lib

A library of basic elements to handle signals in Faust. Its official prefix is  ${\tt si}$ .

# **Functions Reference**

#### bus

n parallel cables. bus is a standard Faust function.

# Usage

```
bus(n)
bus(4) : _,_,_,_
```

Where:

• n: is an integer known at compile time that indicates the number of parallel cables.

#### block

Block - terminate n signals. block is a standard Faust function.

# Usage

```
_{-},_{-},...: block(n): _{-},...
```

Where:

 $\bullet\,$ n: the number of signals to be blocked

# interpolate

Linear interpolation between two signals.

# Usage

```
_,_ : interpolate(i) : _
```

#### Where:

- i: interpolation control between 0 and 1 (0: first input; 1: second input)

-

#### smoo

Smoothing function based on smooth ideal to smooth UI signals (sliders, etc.) down. smoo is a standard Faust function.

# Usage

```
hslider(...) : smoo;
```

## polySmooth

A smoothing function based on smooth that doesn't smooth when a trigger signal is given. This is very useful when making polyphonic synthesizer to make sure that the value of the parameter is the right one when the note is started.

# Usage

```
hslider(...) : polysmooth(g,s,d) : _
```

- g: the gate/trigger signal used when making polyphonic synths
- s: the smoothness (see smooth)
- d: the number of samples to wait before the signal start being smoothed after  ${\tt g}$  switched to 1

#### ${\tt smoothAndH}$

A smoothing function based on smooth that holds its output signal when a trigger is sent to it. This feature is convenient when implementing polyphonic instruments to prevent some smoothed parameter to change when a note-off event is sent.

# Usage

```
hslider(...) : smoothAndH(g,s) : _
```

Where:

- g: the hold signal (0 for hold, 1 for bypass)
- s: the smoothness (see smooth)

bsmooth

Block smooth linear interpolation during a block of samples.

#### Usage

```
hslider(...) : bsmooth : _
```

# dot

Dot product for two vectors of size n.

# Usage

```
_,_,_,_ : dot(n) : _
```

Where:

• n: size of the vectors (int, must be known at compile time)

\_\_\_\_\_

#### smooth

Exponential smoothing by a unity-dc-gain one-pole lowpass. smooth is a standard Faust function.

# Usage:

```
_ : smooth(tau2pole(tau)) : _
```

#### Where:

• tau: desired smoothing time constant in seconds, or

```
hslider(...) : smooth(s) : _
```

#### Where:

• s: smoothness between 0 and 1. s=0 for no smoothing, s=0.999 is "very smooth", s>1 is unstable, and s=1 yields the zero signal for all inputs. The exponential time-constant is approximately 1/(1-s) samples, when s is close to (but less than) 1.

**Reference:** https://ccrma.stanford.edu/~jos/mdft/Convolution\_Example\_ 2\_ADSR.html

# lag\_ud

Lag filter with separate times for up and down.

#### Usage

```
_ : lag_ud(up, dn, signal) : _;
```

# spats.lib

This library contains a collection of tools for sound spatialization. Its official prefix is sp.

# panner

A simple linear stereo panner. panner is a standard Faust function.

# Usage

```
_ : panner(g) : _,_
```

Where:

• g: the panning (0-1)

#### spat

GMEM SPAT: n-outputs spatializer. spat is a standard Faust function.

# Usage

```
_ : spat(n,r,d) : _,_,...
```

Where:

- n: number of outputs
- r: rotation (between 0 et 1)
- d: distance of the source (between 0 et 1)

#### stereoize

Transform an arbitrary processor  ${\tt p}$  into a stereo processor with 2 inputs and 2 outputs.

# Usage

```
_,_ : stereoize(p) : _,_
```

Where:

• p: the arbitrary processor

# synths.lib

This library contains a collection of envelope generators. Its official prefix is sy.

# popFilterPerc

A simple percussion instrument based on a "popped" resonant bandpass filter. popFilterPerc is a standard Faust function.

# Usage

```
popFilterDrum(freq,q,gate) : _;
```

#### Where:

- freq: the resonance frequency of the instrument
- q: the q of the res filter (typically, 5 is a good value)
- gate: the trigger signal (0 or 1)

#### dubDub

A simple synth based on a sawtooth wave filtered by a resonant lowpass. dubDub is a standard Faust function.

#### Usage

```
dubDub(freq,ctFreq,q,gate) : _;
```

- freq: frequency of the sawtooth
- ctFreq: cutoff frequency of the filter
- q: Q of the filter
- gate: the trigger signal (0 or 1)

#### sawTrombone

A simple trombone based on a lowpassed sawtooth wave. sawTrombone is a standard Faust function.

# Usage

```
sawTrombone(att,freq,gain,gate) : _
```

#### Where:

- att: exponential attack duration in s (typically 0.01)
- freq: the frequency
- gain: the gain (0-1)
- gate: the gate (0 or 1)

\_\_\_\_\_

# combString

Simplest string physical model ever based on a comb filter. combString is a standard Faust function.

#### Usage

```
combString(freq,res,gate) : _;
```

# Where:

- freq: the frequency of the string
- res: string T60 (resonance time) in second
- gate: trigger signal (0 or 1)

# additiveDrum

A simple drum using additive synthesis. additiveDrum is a standard Faust function.

# Usage

additiveDrum(freq,freqRatio,gain,harmDec,att,rel,gate) : \_

#### Where:

- freq: the resonance frequency of the drum
- freqRatio: a list of ratio to choose the frequency of the mode in function of freq e.g.(1 1.2 1.5 ...). The first element should always be one (fundamental).
- gain: the gain of each mode as a list (1 0.9 0.8 ...). The first element is the gain of the fundamental.
- harmDec: harmonic decay ratio (0-1): configure the speed at which higher modes decay compare to lower modes.
- att: attack duration in second
- rel: release duration in second
- gate: trigger signal (0 or 1)

#### fm

An FM synthesizer with an arbitrary number of modulators connected as a sequence. fm is a standard Faust function.

#### Usage

```
freqs = (300,400,...);
indices = (20,...);
fm(freqs,indices) : _
```

# Where:

- freqs: a list of frequencies where the first one is the frequency of the carrier and the others, the frequency of the modulator(s)
- indices: the indices of modulation (Nfreqs-1)

# vaeffects.lib

A library of virtual analog filter effects. Its official prefix is ve.

## **Functions Reference**

## moog\_vcf

Moog "Voltage Controlled Filter" (VCF) in "analog" form. Moog VCF implemented using the same logical block diagram as the classic analog circuit. As such, it neglects the one-sample delay associated with the feedback path around the four one-poles. This extra delay alters the response, especially at high frequencies (see reference [1] for details). See moog\_vcf\_2b below for a more accurate implementation.

#### Usage

moog\_vcf(res,fr)

#### Where:

- fr: corner-resonance frequency in Hz ( less than SR/6.3 or so )
- res: Normalized amount of corner-resonance between 0 and 1 (0 is no resonance, 1 is maximum)

#### References

- https://ccrma.stanford.edu/~stilti/papers/moogvcf.pdf
- https://ccrma.stanford.edu/~jos/pasp/vegf.html

# moog\_vcf\_2b[n]

Moog "Voltage Controlled Filter" (VCF) as two biquads. Implementation of the ideal Moog VCF transfer function factored into second-order sections. As a result, it is more accurate than moog\_vcf above, but its coefficient formulas are more complex when one or both parameters are varied. Here, res is the fourth root of that in moog\_vcf, so, as the sampling rate approaches infinity, moog\_vcf(res,fr) becomes equivalent to moog\_vcf\_2b[n](res^4,fr) (when res and fr are constant). moog\_vcf\_2b uses two direct-form biquads (tf2). moog\_vcf\_2bn uses two protected normalized-ladder biquads (tf2np).

```
Usage
```

```
moog_vcf_2b(res,fr)
moog_vcf_2bn(res,fr)
```

# Where:

- fr: corner-resonance frequency in Hz
- res: Normalized amount of corner-resonance between 0 and 1 (0 is min resonance, 1 is maximum)

wah4

Wah effect, 4th order. wah4 is a standard Faust function.

# Usage

```
_ : wah4(fr) : _
```

# Where:

• fr: resonance frequency in Hz

 ${\bf Reference} \quad {\rm https://ccrma.stanford.edu/^{\sim}jos/pasp/vegf.html}$ 

# ${\tt autowah}$

Auto-wah effect. autowah is a standard Faust function.

# Usage

```
_ : autowah(level) : _;
```

## Where:

• level: amount of effect desired (0 to 1).

\_\_\_\_\_

# crybaby

Digitized CryBaby wah pedal. crybaby is a standard Faust function.

# Usage

```
_ : crybaby(wah) : _
```

# Where:

• wah: "pedal angle" from 0 to 1

Reference https://ccrma.stanford.edu/~jos/pasp/vegf.html

#### vocoder

A very simple vocoder where the spectrum of the modulation signal is analyzed using a filter bank. vocoder is a standard Faust function.

#### Usage

```
_ : vocoder(nBands,att,rel,BWRatio,source,excitation) : _;
```

# Where:

- nBands: Number of vocoder bands
- att: Attack time in seconds
- rel: Release time in seconds
- BWRatio: Coefficient to adjust the bandwidth of each band (0.1 2)
- source: Modulation signal
- excitation: Excitation/Carrier signal

163
